Collins, R.L., **Middle atmosphere structure and dynamics: Lidar studies at the South Pole, Syowa and Urbana (gravity waves, stratosphere),** Urbana, University of Illinois, 1994, 146p., University Microfilms order No. 94-16352, Ph.D. thesis. Refs. p.137-144.

Amundsen-Scott Station stratospheric observations yielded a high resolution data set of stratospheric temperature and polar stratospheric cloud (PSC) backscatter ratio profiles during the austral winter and spring of 1990. The observations show that the seasonal development of the clouds is primarily determined by the behavior of the temperature field. The PSCs are composed predominantly of nitric acid trihydrate particles. Correlation with frost-point measurements shows that nitric acid mixing ratios are depressed in the spring. The small-scale structure of the clouds appears to be controlled by gravity waves propagating upward through the clouds. Lidar measurements of the mesospheric Na layer at Amundsen-Scott (1990) and Showa (1985) stations are used to characterize mesopause region gravity wave activity over Antarctica. The structure of the Na layer reflects the general circulation of the high-latitude mesopause. The monochromatic waves observed over Antarctica show the same general characteristics as those reported from other sites. (Auth. mod.)

Gille, J., et al, **Early results of validation and application of CLAES data,** *Advances in space research,* Sep. 1994, 14(9), p.(9)5-(9)11, 5 refs.

CLAES results on temperature and the long-lived trace species CH_4, N_2O, and CF_2Cl_2 are applied to the study of the formation of the antarctic vortex and the expected downward motions in the vortex during the transition from austral summer to winter. The observed variations, showing downward motion of mixing ratio contours, are consistent with expectations. An unexpected result is the indication of larger downward motions in winter near 70°S than over the pole. (Auth.)

Jouzel, J., et al, **Two-step shape and timing of the last deglaciation in Antarctica,** *Climate dynamics,* Apr. 1995, 11(3), p.151-161, Refs. p.159-161.

The authors present a detailed isotopic record analyzed in a new ice core drilled at Dome B in East Antarctica that fully demonstrates the existence of an antarctic cold reversal (ACR). These results suggest that the two-step shape of the last deglaciation has a worldwide character but they also point to noticeable interhemispheric differences. Thus, the coldest part of the ACR, which shows a temperature drop about three times weaker than that recorded during the Younger Dryas (YD) in Greenland, may have preceded the YD. Antarctica did not experience abrupt changes and the two warming periods started there before they started in Greenland. The links between Southern and Northern Hemisphere climates throughout this period are discussed in the light of additional information derived from the antarctic dust record. (Auth. mod.)

Bintanja, R., Van den Broeke, M.R., **Momentum and scalar transfer coefficients over aerodynamically smooth antarctic surfaces,** *Boundary-layer meteorology,* Apr. 1995, 74(1-2), p.89-111, 29 refs.

Vertical profiles of wind speed, temperature and humidity were used to estimate the roughness lengths for momentum (z_0), heat (z_H) and moisture (z_Q) over smooth ice and snow surfaces. The profile measurements were performed in the vicinity of a blue ice field in Queen Maud Land. The values of z_0 over ice ($3 \cdot 10^{-6}$ m) seem to be the smallest ever obtained over permanent natural surfaces. The settling of snow on the ice and the loss of momentum at saltating snow particles serve as momentum-dissipating processes during snow-drift events. The scalar roughness lengths and surface temperature can be evaluated from the temperature and humidity profile measurements if the ratio z_H/z_Q is specified. This new method circumvents the difficult measurement of surface temperature. The scalar roughness lengths seem to be approximately equal to z_0 for a large range of low roughness Reynolds numbers, despite the frequent occurrence of drifting snow. Possible reasons for this agreement with theory of non-saltating flow are discussed. (Auth.)

Naithani, J., Dutta, H.N., Pasricha, P.K., Reddy, B.M., Aggarwal, K.M., **Evaluation of turbulent fluxes over Maitri, Antarctica,** *Boundary-layer meteorology,* Apr. 1995, 74(1-2), p.195-208, 20 refs.

Turbulent fluxes have been evaluated for clear sunny days over Maitri Station using the basic meteorological data recorded at four levels of a 28 m tower. The data are supplemented with radiation data. The surface layer over Maitri remains thermally stratified during the hours of minimum solar insolation, the so-called nighttime period. The surface winds during this period are generally very strong, resulting in high momentum fluxes. In particular, for high winds (>12 m/s), the temperature gradient is found to be less positive than for moderate winds (4 to 7 m/s). Solar insolation provides the daytime heating necessary for the diurnal variation of atmospheric stability and hence for the turbulent fluxes. Thus on clear days, daytime conditions are marked by upward transport of heat with reduced momentum flux, while stable nighttime conditions are marked by a downward heat flux with increased momentum fluxes. (Auth.)

Biggs, P., Canosa-Mas, C.E., Fracheboud, J.M., Shallcross, D.E., Wayne, R.P., **Efficiency of formation of CH_3O in the reaction of CH_3O_2 with ClO,** *Geophysical research letters,* May 15, 1995, 22(10), p.1221-1224, 17 refs.

In an experiment to simulate heterogeneous chemical reactions in the antarctic stratosphere, a discharge-flow apparatus was used to determine the branching ratio α for the channel of the reaction of ClO with CH_3O_2 that leads to the formation of CH_3O. The experiments were performed at 2 Torr pressure and at room temperature. ClO was the excess reactant and was measured by mass spectrometer; CH_3O was detected by laser-induced fluorescence. The value of α was shown to depend on the fraction β of the reaction of CH_3O with Cl atoms that leads to the formation of CH_3O. Comparison with other published results suggests the possibility of three significant product channels for the reaction of CH_3O_2 with ClO. (Auth. mod.)

Van Allen, R., Murcray, F., **Infrared atmospheric absorption and emission studies,** *Antarctic journal of the United States,* 1993, 28(5), p.259-260, 3 refs.

The authors are measuring the infrared absorption spectrum of the atmosphere using the sun as a source from McMurdo Station. They are also measuring the infrared emission spectrum of the atmosphere from Amundsen-Scott Station. The main purpose of this experiment is to collect atmospheric emission data during the austral winter to measure column abundances of water vapor, ozone, fluorocarbon-11, fluorocarbon-12 and nitric acid as well as absolute total radiance in the region of 7-20 microns (500-1,500 wavenumbers). The spectra for 1992 have been calibrated and show a clear improvement in signal-to-noise ratio compared with the first year of the experiment. Even in July, the signal was clear enough to observe the seasonal disappearance of HNO_3.

Johnson, B.J., Deshler, T., **Balloonborne measurements of ozone and aerosol profiles at McMurdo Station, Antarctica, during the austral spring of 1992,** *Antarctic journal of the United States,* 1993, 28(5), p.260-262, 4 refs.

Balloonborne instruments were launched from McMurdo Station to measure vertical profiles of ozone and aerosol. Thirty-four profiles of ozone, 3 condensation nuclei profiles and 8 profiles of aerosol between 0.15 and 10.0 µm in radius, in 8 size classes, were measured from Aug. 23 through Oct. 31, 1992. Polar stratospheric clouds (PSCs) were observed from the initial sounding in late Aug. until the middle of Sep. The 1992 measurements provide evidence that volcanic aerosol does play a major role in ozone depletion, presumably through the heterogeneous chlorine chemistry that occurs on the additional surface area from the volcanic aerosol or by acting as a nucleation site for additional growth of PSCs. The decay of the volcanic aerosol in the stratosphere will reduce the number of concentrations for the 1993 season but may continue to have an impact on ozone depletion.

De Zafra, R.L., Emmons, L.K., Reeves, M., Shindell, D.T., Trimble, C., **Field observations of stratospheric trace gases in support of the upper atmospheric research satellite mission during the antarctic spring of 1992,** *Antarctic journal of the United States,* 1993, 28(5), p.262-263, 5 refs.

This research is intended to provide correlative data in support of instruments on the National Aeronautic and Space Administration's upper atmospheric research satellite (UARS), as well as to gather independent data pertaining to ozone loss during the antarctic spring season. Due to the early seasonal nature of ozone loss over Antarctica, this research must be carried out during the winter fly-in period at McMurdo Station. Following an initial period of setting up and debugging of equipment, the authors carried out observations almost continuously from Sep. 9 until Oct. 10.

I-53062

Trimble, C., De Zafra, R.L., **Observation of trace gases in the stratosphere over a 1-year cycle at the South Pole,** *Antarctic journal of the United States,* 1993, 28(5), p.264-265, 4 refs.

During Sep. 1993 the authors monitored the large increase in low-altitude ClO in the antarctic spring, signifying the chemical attack on ozone by chlorine that leads to formation of the ozone hole, and followed the dynamical breakup of the vortex in Nov. by continued monitoring of N_2O and O_3. They made an unsuccessful search for hydrogen peroxide (H_2O_2), resulting at least in a useful upper limit being placed for the first time on how much may be present in the polar night stratosphere. They also obtained a large volume of unique data on several species (O_3, N_2O, HNO_3, NO_2, ClO, and H_2O_2) and made some unanticipated observations that should prove to be of considerable significance in characterizing dynamical and chemical effects occurring in the heart of the antarctic winter vortex.

Khalil, M.A.K., Rasmussen, R.A., **Carbon monoxide in the antarctic atmosphere: observations of decreasing concentrations,** *Antarctic journal of the United States,* 1993, 28(5), p.265-267, 7 refs.

Data from Antarctica that suggest recent decreases in the concentration of CO are reported. Data are available between 1980 and 1992 from three experiments. CO concentrations increased during the first half of the period (1980-86) and decreased in the second half (1986-92). Overall, the decrease in recent years has more than compensated for the increases in earlier years, so that CO concentrations now (1991-92) are lower by about 10±3 ppbv compared with concentrations a decade ago (1980-81).

Montzka, S.A., Myers, R.C., Butler, J.H., Elkins, J.W., Cummings, S.O., **Atmospheric measurements of HCFC-22 at the South Pole,** *Antarctic journal of the United States,* 1993, 28(5), p.267-269, 13 refs.

The authors report HCFC-22 measurements made at Amundsen-Scott Station through the end of 1992 and discuss them in light of results obtained at the next nearest station, Cape Grim. The growth rate of atmospheric HCFC-22 during 1992 at Amundsen-Scott Station was identical to the rate observed at Cape Grim, at 5.3 ppt per year. This rate is also consistent with a previous estimate for the Southern Hemisphere during 1992. A mean atmospheric mixing ratio of 95 ppt was determined for HCFC-22 during 1992 at the Amundsen-Scott Station. Similar mixing ratios were observed at Cape Grim, suggesting that the mixing ratio of HCFC-22 is fairly constant in the Southern Hemisphere below 40°S. Comparisons between results from the two stations suggest that HCFC-22 is stable in both dry and wet flask samples for extended periods.

Warren, S.G., Starbuck, M., Groeneveld, C., **Relative elevations of meteorological facilities at South Pole Station,** *Antarctic journal of the United States,* 1993, 28(5), p.271-273, 1 ref.

Detailed information about the temperature profile near the surface is needed to interpret the measured infrared radiation spectra and to evaluate the turbulent heat fluxes. At Amundsen-Scott Station this profile can be obtained from radiosonde launches, together with temperature measurements at the snow surface, at the standard reporting height of 2 m above the surface, and near the top of the 23 m meteorological tower. The height of the radiosonde-launching deck has changed since its installation in the summer of 1974-75 relative to the 2 m thermometers, which are raised every year as the surface snow accumulates and rises against the meteorological towers. A table is presented showing elevations of benchmarks and meteorological facilities at Amundsen-Scott Station in Oct. and Nov. 1992.

Liu, Z., Bromwich, D.H., **Observational study of boundary-layer dynamics over West Antarctica,** *Antarctic journal of the United States,* 1993, 28(5), p.277-280, 11 refs.

The boundary layer features inside the Siple Coast Confluence Zone have been derived from analyses of 1992 field observations. The data acquisition period started on Nov. 11 and ended on Dec. 8. In contrast to the situation in wintertime, the katabatic winds and surface air temperatures show significant diurnal variations which, for the surface air temperature, are a strong function of wind speed. The thermal structure of the boundary layer can be modified by the presence of strong winds and warm air advection.

I-53070

Du, Y., Bromwich, D.H., **Summer surface winds in the Siple Coast confluence zone, West Antarctica,** *Antarctic journal of the United States,* 1993, 28(5), p.280-282, 10 refs.

This paper summarizes the summer wind and temperature fields obtained from a three-dimensional primitive equation mesoscale numerical model, with emphasis on the influence of diurnal insolation on the windfield. The general near-surface wind pattern over Siple Coast is reasonably well reproduced by the mesoscale numerical model. The effect of the diurnal solar forcing on the surface wind is significant. The predicted near-surface wind profile for Upstream B is in good agreement with the observations from the 1992-93 field experiment. Both the observed fluctuations of the low-level jet (LLJ) height and the timing of its change are obtained in the numerical simulation.

Smith, S.R., Carrasco, J.F., Liu, Z., **Case study of a Siple Coast mesocyclone,** *Antarctic journal of the United States,* 1993, 28(5), p.283-285, 8 refs.

The presence of a strong synoptic-scale low off the coast of Marie Byrd Land along with a midtropospheric ridge resulted in a sharp baroclinic zone between Upstream B Camp and Byrd Station in West Antarctica. A mesoscale cyclone formed along this baroclinic zone on or near 0000 UTC on Nov. 11, 1992 and underwent explosive development over the next 9 h. The mesocyclone reached its peak intensity around 0000 UTC on Nov. 12.

Carrasco, J.F., Bromwich, D.H., **Katabatic-wind-forced mesoscale cyclone development over the Ross Ice Shelf near Byrd Glacier during summer,** *Antarctic journal of the United States,* 1993, 28(5), p.285-288, 13 refs.

A mesoscale cyclone formed near Byrd Glacier in association with katabatic drainage from that glacier. The second synoptic cyclone seemed to contribute to the southward extension of the semipermanent subsynoptic surface trough located around Franklin I., whereas the midtropospheric southerly and southwesterly winds could support the intensification of the katabatic winds. The temporary retrogression of the midtropospheric trough toward the Ross Sea/Ross Ice Shelf area could provide upper-level support for cyclogenesis but not for its subsequent development. This study provides another example of katabatic-wind-forced mesoscale cyclogenesis near Byrd Glacier and its association with a similar area farther north around Franklin I.

I-53073

Liu, Z., Bromwich, D.H., **Northwesterly wind event near Ross Island,** *Antarctic journal of the United States,* 1993, 28(5), p.288-291, 15 refs.

The prevailing wind field in the Ross I. area in summer breaks down frequently and is replaced by northwesterly winds due to decreasing strength of the katabatic winds and increasing mesoscale pressure gradients. The mesoscale systems steer the drainage flow away from its normal propagation direction. The geographic location of Ross I. at the edge of the vast flat Ross Ice Shelf also provides opportunities for intrusion of synoptic-scale systems. Both SODAR and RASS proved to be useful for explaining the observed boundary layer wind and temperature changes, but more deployments in the surrounding area are needed to understand the detailed causes of such changes and their relation to the adverse weather affecting the area.

I-53074

Stearns, C.R., Weidner, G.A., **Snow temperature, wind speed, and wind direction around the Pegasus Runway during 1992,** *Antarctic journal of the United States,* 1993, 28(5), p.291-294, 3 refs.

Automatic weather station (AWS) units are installed at the north and south ends of the Pegasus blue-ice runway on the Ross Ice Shelf near Ross I. and at the Minna Bluff, Williams Field and Linda AWS sites in support of the meteorology of the blue-ice runway. Determining the differences between the wind speed and direction observations at the Minna Bluff site minus the Pegasus North AWS site is the start of an attempt to determine the potential for wind shear in the vertical at Pegasus Runway. The southerly wind passing Minna Bluff is assumed to continue over Pegasus Runway at the elevation of the Minna Bluff AWS site. Based on the above assumption, the wind-speed difference from the surface to 900 m could be as much as 10 m/s. This difference is not a problem when aircraft are taking off to the south but could be a problem for takeoff to the north. The opposite problem occurs when aircraft are landing.

Parish, T.R., Bromwich, D.H., **Katabatic wind forcing on the**

antarctic circumpolar easterlies, *Antarctic journal of the United States,* 1993, 28(5), p.294-295, 4 refs.

To examine the interaction between the katabatic wind regime and the large-scale horizontal pressure field around the antarctic continent, a series of two-dimensional numerical experiments has been conducted using a hydrostatic primitive equation model. The model simulation was carried out for a 24-hour period, by which time a near-steady katabatic wind circulation had evolved. Emphasis is placed on the modification of the horizontal pressure field by the katabatic wind regime. Results are representative of observed features and suggest that the antarctic katabatic wind regime offers at least a supportive role in the development of the easterly wind regime about the continent.

Holmes, R.E., Stearns, C.R., Weidner, G.A., **Antarctic automatic weather stations: austral summer 1992-1993,** *Antarctic journal of the United States,* 1993, 28(5), p.296-299, 2 refs.

The National Science Foundation's Office of Polar Programs places automatic weather station (AWS) units in remote areas in Antarctica in support of meteorological research and operations. The basic AWS units measure air temperature, wind speed, and wind direction at a nominal height of 3 m above the surface as well as air pressure at the electronics enclosure. Some units measure relative humidity at 3 m and the air temperature difference between 3 and 0.5 m above the surface at the time of installation. The data are collected by the ARGOS Data Collection System on board the NOAA series of polar-orbiting satellites. A table gives the AWS unit's site name, latitude, longitude, elevation above sea level, and site start date for AWS units installed through 1993. The AWS units are grouped based on the area and usually are related to a single meteorological experiment in the area.

Sun, J.H., Xia, Q.L., Qiu, J.H., Lü, D.R., **Lidar observations of polar stratospheric clouds in Antarctica,** *Antarctic Research (Chinese edition),* Mar. 1995, 7(1), p.44-49, In Chinese with English summary. 5 refs.

A lidar system (694nm) was used to measure stratospheric aerosols at Zhongshan Station between Mar. 27 and Nov. 5, 1993; a total of 53 observations were made. Vertical profiles of stratospheric aerosol backscattering ratio and the integrated backscatter coefficients over a 12-30 km altitude range are presented. The seasonal variation of the integrated backscatter coefficient (IBC) is also presented. A noticeable maximum of the IBC occurs in winter. Polar stratospheric clouds are observed from late May until Sep. The vertical profiles of the stratospheric aerosol backscattering ratio clearly show a double-layer structure: one at an altitude of about 12 km, and another at about 25 km. (Auth. mod.)

DLC GB2401.M37

The ice core obtained at Vostok Station from a depth of 2546 m is constituted of ice formed during 200 thousand years. Isotope temperature data have indicated two interglacials, which started 140 and 15 ka with abrupt warmings, by 11° and 9°C, respectively, and the long Ice Age, 110-15 ka, including two interstadials. During the cooling periods the snow accumulation decreased twice, the concentration of aerosols grew 10-20 times, and concentration of CO_2 in the atmosphere decreased by 25-30%. The coolings were accompanied by an increase of atmospheric circulation, especially of meridional transfer. (Auth. mod.)

Lugar, R.M., **FY 1994 ambient air monitoring report for McMurdo Station, Antarctica,** *U.S. Department of Energy. Idaho National Engineering Laboratory,* Dec. 1994, INEL-94/0114, 62p., DE95-008565, Refs. p.31-32.

This report presents the results of ambient air monitoring performed during the 1994 fiscal year in the vicinity of McMurdo Station. Routine monitoring was performed during the 1993-94 austral summer at three locations for airborne particulate matter less than 10 microns (PM-10) at two locations for carbon monoxide, sulfur dioxide, nitrogen oxides, and NO_x. Selected PM-10 filters wre analyzed for arsenic, beryllium, cadmium, chromium, lead, mercury, and nickel. Additional air samples were collected at three McMurdo area locations and at Black I. for determination of the airborne concentration of polychlorinated dibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs). DLC TD881.P485

Increasing methane increases the stratospheric water vapor which during the antarctic winter is frozen in stratospheric particles. The particles are built up according to the specific vapor pressure of the constituting substances: sulfuric acid in the core of the particles and other less volatile substances like HNO_3 and HCl in surrounding shell, together with H_2O-ligands. Induced by the low temperatures in the antarctic winter (-80°C), in addition to HNO_3 and HCl, NO_2 is also frozen on the surface of the ice particles. Due to reactions with HCl located on the surface, CL_2 and other ozone-attacking species are set free. It is postulated that during the antarctic sunrise in spring by charge transfer processes in the particles hydrated electrons are induced which react at the surface with H^+-ions, N_2O and chlorinated halocarbons. By these processes the ozone-attacking radicals H, OH and Cl are generated. (Auth. mod.)

Toon, G.C., Blavier, J.F., Szeto, J.T., **Latitude variations of stratospheric trace gases,** *Geophysical research letters,* Nov. 15, 1994, 21(23), p.2599-2602, 7 refs.

The authors present vertical column abundances of H_2O, N_2O, HNO_3, NO_2, O_3, HF, HCl, and $ClNO_3$ determined from solar absorption spectra measured by the JPL MkIV interferometer from the NASA DC-8 aircraft. These observations, taken in 1987 and 1992, covered latitudes ranging from 85°S to 85°N. Although most gases display latitude symmetry, large asymmetries in H_2O, HNO_3, and O_3 are apparent, which can be ascribed to processes enhanced by the colder antarctic winter temperatures. Jones, P.D., **Recent variations in mean temperature and the diurnal temperature range in the Antarctic,** *Geophysical research letters,* June 1, 1995, 22(11), p.1345-1348, 17 refs.

Monthly mean surface temperature data are available from nearly twenty stations in Antarctica for the period since the International Geophysical Year 1957. All but three stations show an increase in mean temperatures over this time, amounting in the average to 0.57°C from 1957 to 1994, warming which occurred before the early 1970s. Since then, there has been no change. The warming has been greatest in the Antarctic Peninsula. Analyses of the less-widely available diurnal temperature range (DTR) data show regions of increase and decrease over Antarctica. An average continental DTR series shows no trend from 1957 to 1992. Analyses for six mid-to-high latitude southern ocean islands show increases in mean temperature from 1961-90. Given the low year-to-year variability in these data, these trends are more significant than for any of the stations on the antarctic continent. The marked decrease in mean temperatures over Antarctica during 1993 and 1994 seems unrelated to sea-ice variations which show little change since the early 1980s. (Auth. mod.)

Tabazadeh, A., Toon, O.B., Hamill, P., **Freezing behavior of stratospheric sulfate aerosols inferred from trajectory studies,** *Geophysical research letters,* July 1, 1995, 22(13), p.1725-1728, 23 refs.

Temperature histories for both polar atmospheres based on 10-day back trajectories for six ER-2 flights during 1989 and 1987 are presented. These trajectories along with the properties of the observed PSC (polar stratospheric cloud) particles are used here to infer the physical state of the preexisting sulfuric acid aerosols. Of the ER-2 flights described here, only PSCs observed on the flights of Jan. 24 and 25, 1989 are consistent with the thermodynamics of liquid ternary solutions. The observed PSCs were probably composed of amorphous solid solutions of HNO_3 and H_2O. The temperature histories, recent laboratory measurements and the properties of glassy solids suggest that stratospheric H_2SO_4 aerosols may undergo a phase transition to SAT (sulfuric acid tetrahydrate) upon warming at ≈198 K after going through a cooling cycle to about 194 K or lower. (Auth. mod.)

Collins, R.L., Gardner, C.S., **Gravity wave activity in the stratosphere and mesosphere at the South Pole,** *Advances in space research,* 1995, 16(5), p.81-90, 30 refs.

A Rayleigh/resonant lidar was installed at the Amundsen-Scott Station in Dec. 1989 and made observations of the mesosphere and stratosphere through Oct. 1990. The wintertime lidar observations yielded a high resolution data set of sodium (Na) density profiles in the mesosphere and polar stratospheric cloud (PSC) backscatter ratio profiles in the stratosphere. These observations illustrate a variety of wave phenomena present in the antarctic middle atmosphere. The observations of the mesospheric Na layer were used to characterize gravity wave activity in the upper mesosphere between 80 and 105 km. Strong wave activity was observed throughout the winter and exhibited remarkable similarity with observations from lower latitude sites. The mean density variance at the South Pole was similar to that observed at a variety of lower latitude sites. (Auth. mod.)

Denning, A.S., Fung, I.Y., Randall, D., **Latitudinal gradient of atmospheric CO_2 due to seasonal exchange with land biota,** *Nature,* July 20, 1995, 376(6537), p.240-243, 31 refs.

Measurements of CO_2 concentrations at remote marine sites have been used with numerical models of atmospheric transport to deduce the location, nature and magnitude of carbon sinks. One of the most important constraints on such estimates is the observed interhemispheric gradient in atmospheric CO_2 concentration. Published models that simulate the transport of trace gases suggest that the gradient is primarily due to interhemispheric differences in fossil-fuel emissions, with small contributions arising from natural exchange of CO_2 with the various carbon reservoirs. Used here is a full atmospheric general circulation model with a more realistic representation of turbulent mixing near the ground to investigate CO_2 transport. The latitudinal (meridional) gradient imposed by the seasonal terrestrial biota is nearly half as strong as that imposed by fossil-fuel emissions. Such a contribution implies that the sinks of atmospheric CO_2 in the Northern Hemisphere must be stronger than previously suggested. The coverage in this study is global, including data for both polar regions, with CO_2 values at the South Pole being deduced at every grid point. (Auth. mod.)

Jones, A.E., Shanklin, J.D., **Continued decline of total ozone over Halley, Antarctica, since 1985,** *Nature,* Aug. 3, 1995, 376(6539), p.409-411, 31 refs.

The authors review the status of the ozone hole based on the continued total-ozone measurements at Halley. The springtime ozone hole continues to deepen, with both the October mean and minimum total ozone persistently decreasing. The ozone loss extends into Jan. and Feb., so that significant increases in ultraviolet-B radiation can be expected at the surface over Antarctica during the summer. A signal of ozone loss is now apparent in the spring and summer temperature records, with recent temperatures at the 100-mbar level consistently close to, or colder than, the historical (1957-72) minima for the period Oct. to Jan. These low temperatures may well enable the maintenance of springtime ozone-loss mechanisms until later in the year. (Auth. mod.)

Fraser, G.J., **Summer circulation in the antarctic middle atmosphere,** *New Zealand antarctic record,* 1983, 4(3), p.1-3, 6 refs.

In Nov. 1982 a partial reflection drifts system for the measurement of winds in the mesosphere and lower thermosphere was installed as part of the New Zealand Antarctic Research Programme at Scott Base, Ross I. The wind speed and direction are measured once an hour from echoes available at the time within a height range of 67-97 km. Initial observations made during Dec. 1982 show easterly winds between 70 and 90 km, reaching a broad maximum of about 25 m/sec around 85 km. There is a strong (≈10 m/sec) meridional component away from the pole at heights of 85-95 km.

Chamberlin, R.A., Bally, J., **Observed relationship between the South Pole 225-GHz atmospheric opacity and the water vapor column density,** *International journal of infrared and millimeter waves,* May 1995, 16(5), p.907-920, 18 refs.

The authors compare previously reported measurements of South Pole 225 GHz atmospheric opacity, τ, to the column of precipitable water vapor (PWV) which was derived from concurrent upper air soundings. From this comparison they found that $\tau = (2.8\pm0.1) \times 10^{-2} + (6.9\pm0.2) \times 10^{-2} \times \mathrm{PWV}$ with τ in units of nepers/airmass and PWV in units of mm of precipitable H_2O. Results were compared to predictions from Grossman's AT atmospheric transparency model which is widely used in the radio astronomy community. The coefficient of the second term of the above relation, 0.069, was consistent with the predictions from the model; however, the first term, 0.028, which represents the dry air opacity, was about five to ten times larger than expected. Most of this discrepancy between the observed and the predicted dry air opacity can be accounted for by including contributions from continuum emission from N_2 and O_2 as is done in Liebe's MPM atmospheric model. McIntyre, M.E., Pyle, J.A., **Model studies of dynamics, chemistry and transport in the antarctic and arctic stratospheres,** British Antarctic Survey Antarctic Special Topic Award Scheme Round 2 Symposium, Sep. 30-Oct. 1, 1992. Proceedings. University research in Antarctica, 1989-92, edited by R.B. Heywood, Cambridge, British Antarctic Survey, 1993, p.17-34, Refs. p.33-34.

This work is part of an ongoing effort to improve the understanding of the interacting radiative, chemical and fluid-dynamical processes that control the present behavior and future evolution of the stratospheric ozone layer, motivated by recent observations of polar and mid-latitude ozone depletion. Progress in modelling different aspects of the problem is described, which demand consideration of many nonlinear interactions over a vast range of spatial scales of motion, and over chemical and dynamical time scales from fractions of a second to many years. One fundamental aspect is the comparative study of the antarctic and arctic stratospheres, and the way in which the polar vortex regions fit into the global-scale circulation of the middle atmosphere. A new technique, contour advection, borrowed from recent work on idealized vortex dynamics, is put to use for the first time as a high-powered computational tool for the numerical simulation of tracer advection at unprecedented, and closely controllable, accuracies. (Auth. mod.)

James, I.N., **Antarctic circulation in the Universities' Global Atmospheric Modelling Project (UGAMP) model,** British Antarctic Survey Antarctic Special Topic Award Scheme Round 2 Symposium, Sep. 30-Oct. 1, 1992. Proceedings. University research in Antarctica, 1989-92, edited by R.B. Heywood, Cambridge, British Antarctic Survey, 1993, p.35-41, 13 refs.

The tropospheric circulation over Antarctica, as represented in the UGAMP Global Circulation model, has been diagnosed. Particular emphasis has been placed on the surface wind regime and continent-wide inversion. Persistent surface drainage winds are well simulated over the interior of the antarctic plateau. The model has insufficient resolution to simulate the very strong localized katabatic flows emerging at certain localities around the coastline, although the results do show some indications of local concentrations of low level mass fluxes off the ice sheet. The larger scale upper level circulation in the antarctic region generally verifies well against ECMWF climatology; however, the circumpolar trough is too deep and the surface winds correspondingly too strong. (Auth. mod.)

Jones, P.D., Wigley, T.M.L., **Decadal timescale links between Antarctic Peninsula ice-core oxygen-18, deuterium and temperature,** British Antarctic Survey Antarctic Special Topic Award Scheme Round 2 Symposium, Sep. 30-Oct. 1, 1992. Proceedings. University research in Antarctica, 1989-92, edited by R.B. Heywood, Cambridge, British Antarctic Survey, 1993, p.97-98, 5 refs.

The Antarctic Peninsula region has experienced a long-term warming trend over the 20th century, with the 1971-90 mean at Faraday Station being 1.9°C warmer than the mean over 1904-41 based on expedition reports. For the period prior to 1900 there is conflicting evidence from different data sources. An initial interpretation of isotopic data from ice cores suggests that the 19th century was warmer than the 20th century. In contrast, snow accumulation rate data for the 19th century from the same ice cores suggest lower temperatures. The authors investigate these facts by studying the links between atmospheric temperature over the Antarctic Peninsula, circulation parameters and isotopic data over the period of instrumental records. Sowers, T., Bender, M., **Climate records covering the last glaciation,** *Science,* July 14, 1995, 269(5221), p.210-214, 61 refs.

The oxygen-18/oxygen-16 ratio of molecular oxygen trapped in ice cores provides a time-stratigraphic marker for transferring the absolute chronology for the Greenland Ice Sheet Project (GISP) II ice core to the Vostok and Byrd ice cores in Antarctica. Comparison of the climate records from these cores suggests that near the beginning of the last deglaciation, warming in Antarctica began approximately 3000 years before the onset of the warm Bølling period in Greenland. Atmospheric carbon dioxide and methane concentrations began to rise 2000 to 3000 years before the warming began in Greenland and must have contributed to deglaciation and warming of temperate and boreal regions in the Northern Hemisphere. (Auth.)

Iraci, L.T., Middlebrook, A.M., Wilson, M.A., Tolbert, M.A., **Growth of nitric acid hydrates on thin sulfuric acid films,** *Geophysical research letters,* May 15, 1994, 21(10), p.867-870, 16 refs.

Type I polar stratospheric clouds (PSCs) are thought to nucleate and grow on stratospheric sulfate aerosols (SSAs). To model this system, thin sulfuric acid films were exposed to water and nitric acid vapors and subjected to cooling and heating cycles. FTIR spectroscopy was used to probe the phase of the sulfuric acid and to identify the HNO_3/H_2O films that condensed. Nitric acid trihydrate (NAT) was observed to grow on crystalline sulfuric acid tetrahydrate (SAT) films. NAT also condensed in/on supercooled H_2SO_4 films without causing crystallization of the sulfuric acid. This growth is consistent with NAT nucleation from ternary solutions as the first step in PSC formation. (Auth. mod.)

Beyer, K.D., Seago, S.W., Chang, H.Y., Molina, M.J., **Composition and freezing of aqueous H_2SO_4/HNO_3 solutions under polar stratospheric conditions,** *Geophysical research letters,* May 15, 1994, 21(10), p.871-874, 13 refs.

The results of laboratory investigations of the freezing behavior of aqueous acid solutions indicate that in the polar stratosphere, H_2SO_4/H_2O aerosol droplets would not freeze at temperatures above the ice frost point in the absence of HNO_3; however, in the presence of typical levels of HNO_3 liquid sulfuric acid aerosols take up significant amounts of HNO_3

and H_2O vapors and freeze much more readily. This is a consequence of the very rapid change in composition of the liquid droplets as the temperature drops to within two to three degrees of the equilibrium temperature at which HNO_3 and H_2O vapors would co-condense to form a liquid solution. In the high latitude stratosphere this HNO_3/H_2O 'dew point' is typically around 192-194 K at 100 mbar. (Auth. mod.)

Delmas, R.J., Petit, J.R., **Present antarctic aerosol composition: a memory of ice age atmospheric dust?,** *Geophysical research letters,* May 15, 1994, 21(10), p.879-882, 32 refs.

Data obtained from the chemical analysis (Na, Al, and Ca concentrations) of deep antarctic ice cores has been re-examined. The correlations found between the concentrations of these elements suggest that the Patagonian continental shelf was the dominant aerosol source during the last ice age, the dust being an intimate mixture of marine clay and carbonates. In addition, it is proposed that sea salt deposited on the continental shelf sediments during drop in sea level was emitted and transported jointly with this dust. The present antarctic aerosol composition is very similar to the one deduced from ice core studies for glacial climatic conditions. The authors conclude that present antarctic aerosol originates mainly from ice-age aeolian deposits in South American cold deserts. (Auth. mod.)

Sodeau, J.R., Horn, A.B., Banham, S.F., Koch, T.G., **Ionization of chlorine nitrate on ice at 180 K,** *Journal of physical chemistry,* Apr. 20, 1995, 99(16), p.6258-6262, 16 refs.

Fourier Transform Infrared Spectroscopy evidence is provided for the identification of chlorine nitrate $[H_2OCl]^+$ as an intermediate in the ionization of chlorine nitrate on water-ice at the stratospherically relevant temperature of 180 K. The result has important implications for the mechanism by which chlorine is reactivated by polar stratospheric clouds and suggests that the function of water molecules is to reduce the activation energy barrier for chlorine nitrate bond cleavage on the ice. DLC QC.912.3.A83 1993

This book contains the proceedings of a meeting on atmospheric radiation held in Tromsø, Norway, June 30-July 1, 1993. Of a total of 41 papers, 15 are pertinent to high latitudes, and of those, five are explicitly pertinent to Antarctica. The papers pertinent to Antarctica deal with polar climate studies from space; solar flux between clouds and the underlying surface; two papers on the effect of atmospheric ozone content on surface UV irradiance; and the infrared optical properties of clouds. Global warming concerns are addressed in several of the papers.

DLC QC.912.3.A83 1993

The polar regions are expected to be particularly sensitive to anthropogenic global change. Due to the difficulties in modeling high-latitude climate and the logistical challenges with polar field work, satellite remote sensing will have an increasingly important role to play in polar climate research. For studies of atmospheric radiation and meteorology, accurate cloud detection and classification are crucial. Modern methods for polar cloud classification utilize both multispectral threshold and automated pattern recognition techniques. For monitoring sea ice concentration, passive microwave sensors offer an all-weather advantage over visible or infrared scanners, although over clear-sky scenes the latter can provide a much finer spatial resolution. Proceedings,* 1993, Vol.2049, Atmospheric Radiation, Tromsø, Norway, June 30-July 1, 1993. Edited by K.H. Stamnes, p.24-36, 13 refs.

DLC QC.912.3.A83 1993

The Discrete Ordinate Radiative Transfer (DISORT) model has been used to investigate the role of cloud-surface interactions on the net surface solar flux in various atmospheric and surface conditions. These model-based results indicate that the partitioning of radiation between the atmosphere and the surface largely varies with cloud and surface conditions. Particularly, the amount of solar radiation absorbed by the atmosphere depends strongly on the type of surface underlying clouds and on cloud properties and type. This suggests that if in a global change scenario, for instance, cloud cover were to remain constant but clouds were to move from overlying the ocean to overlying much more reflecting surfaces, the radiation partitioning would be quite different and so probably would the atmospheric and oceanic circulations. The strongest change would occur if clouds were to move from ocean to snow or ice surfaces, as this could occur at high latitudes, in the vicinity of snow/ice edges. In a scenario where there is no change in cloud type but just a north or south cloud shift in the Southern Hemisphere in the vicinity of Antarctica, where the largest cloud forcing occurs, results suggest that a large change of absorption partitioning between the atmosphere and the surface could take place, if the clouds moved from being mostly located over an oceanic surface to being located mostly over a snow surface (or vice versa). (Auth. mod.)

DLC QC.912.3.A83 1993

Two methods have been investigated to map UV surface irradiance over Antarctica and the adjacent oceans using satellite remote sensing and ground truth radiometer measurements. Both methods are based on radiance observations from the Advanced Very High Resolution Radiometer (AVHRR) and from the Total Ozone Mapping Spectrometer (TOMS). Surface albedo and cloud optical depth are estimated from visible and infrared AVHRR data, and ozone concentration is derived from TOMS data. Radiative transfer models are applied to retrieve geophysical parameters from satellite data but also to compute the surface UV irradiance. The two methods differ in: (1) the derivation of cloud optical depth, and (2) the type of radiative transfer model used. Preliminary results from both methods are presented and compared with ground measurements made at Palmer Station. (Auth.)

Lubin, D., Gautier, C., **Infrared optical properties of clouds over the maritime Antarctic: radiometric FTIR measurements,** *SPIE—The International Society for Optical Engineering. Proceedings,* 1993, Vol.2049, Atmospheric Radiation, Tromsø, Norway, June 30-July 1, 1993. Edited by K.H. Stamnes, p.279-290, 13 refs.

DLC QC.912.3.A83 1993

Spectrally resolved radiometric measurements of middle infrared atmospheric emission can be used in conjunction with detailed radiative transfer calculations to retrieve cloud emissivity, and to estimate cloud liquid water path (LWP), optical depth, and equivalent radius of the droplet size distribution. Using a discrete-ordinates radiative transfer formulation, an algorithm has been developed to retrieve these cloud properties from FTIR data. The algorithm has been successfully applied to a four-month antarctic data set provided by the CalSpace FTIR Spectroradiometer. Radiative transfer calculations were performed to estimate spectral cloud emissivity for a range of cloud optical depth, liquid water content, and equivalent radius, sufficient to bracket values expected in the field. These calculations made use of bi-modal droplet size distributions actually observed in antarctic clouds. Using a least-squares algorithm, a theoretical cloud emission spectrum is chosen which best reproduces a given measured brightness temperature spectrum. The results show marked differences in cloud emissivity between high and low overcast layers, and between clouds with and without precipitation. (Auth. mod.)

Proceedings,* 1993, Vol.2049, Atmospheric Radiation, Tromsø, Norway, June 30-July 1, 1993. Edited by K.H. Stamnes, p.296-306, 18 refs.

DLC QC.912.3.A83 1993

Spectral ultraviolet measurements in the wavelength range 290 to 325 nm made at Sodankylä, Finland in 1990-92 were used to study the effects of surface albedo, atmospheric total ozone and atmospheric aerosol content on UV irradiance on the surface of the Earth. A two-stream version of the discrete-ordinate-algorithm developed at the University of Alaska Fairbanks was tested against spectral measurements from Sodankylä, Norrköping in Sweden and Palmer Station. Agreement was excellent as regards Palmer Station data. However, with the two Northern Hemispheric data sources all model results were roughly 40% higher in the 305-325 nm range and matched below 305 nm within ±20%. A case study with data having common optical air masses and total ozone contents from all three sources revealed unexpectedly high irradiances at Palmer Station. The spectral ranges available were 290 to 325 nm in Sodankylä, 290 to 320 nm in Norrköping and 279.9 to 380.22 nm at Palmer Station. All data were presented at a resolution of about 0.5 nm. Surface UV irradiance at air mass 1.4±0.05 is 50 to 80% stronger in Antarctica than in Scandinavia with roughly similar total ozone contents. This result was unexpected and remains to be explained. (Auth. mod.)

Danilin, M.Y., McConnell, J.C., **Stratospheric effects of bromine activation on/in sulfate aerosol,** *Journal of geophysical research,* June 20, 1995, 100(D6), p.11,237-11,243, 28 refs.

Heterogeneous reactions on/in stratospheric sulfate aerosol and polar stratospheric clouds are important in the photochemical balance of the stratosphere. Recent laboratory measurements indicate that heterogeneous reactions with bromine compounds are possible under stratospheric conditions. Herein a box photochemical model of the stratosphere with a detailed heterogeneous module is presented to evaluate the effect of heterogeneous reactions of the inorganic bromine for background and volcanic conditions at 60°S and 50 mbar. For the conditions studied the most important reaction is the hydrolysis of $BrONO_2$ on the aerosol, especially for volcanic conditions. It results in the indirect increase of the ClO_x fraction due to the suppression of NO_x (thus reducing $ClONO_2$) and the direct release of ClO_x due to additional consumption of HCl. The NO_x decrease is pronounced going into winter and leads to a ClO activation to about 0.5 ppvb 1 to 2 weeks earlier than without the heterogeneous reactions of bromine species. Due to the temperature sensitivity of the solubility of HCl, the reaction $HOBr + HCl(a) \rightarrow BrCl + H_2O$ results in direct activation of ClO at temperatures below ≈205 K. The enhanced processing for the bromine reactions leads to an additional increase ≈30% in ozone depletion for volcanic conditions during winter. (Auth. mod.)

Robock, A., Free, M.P., **Ice cores as an index of global volcanism from 1850 to the present,** *Journal of geophysical research,* June 20, 1995, 100(D6), p.11,549-11,567, 87 refs.

To evaluate an important cause of past climate change, climate researchers need reliable estimates of volcanic aerosol loading in the atmosphere. Ice core acidity and sulfate records, because they contain physical evidence of atmospheric loading, are a promising source of information on past volcanic aerosols, but these records contain large nonvolcanic signals as well. This study compares Northern Hemisphere (NH) and Southern Hemisphere (SH) annual-average versions of five indices with eight NH and six SH ice core records for the period 1850 to the present in an attempt to identify the volcanic signal common to all records. The indices are all highly correlated with each other. For the NH, although the individual ice core records are, in general, not well correlated with each other or with any of the indices, a composite derived from averaging the cores, the ice core-volcano index (IVI), shows promise as a new index of volcanic aerosol loading. This new index correlates well with the existing non-ice core volcanic indices and with high-frequency temperature records. For the SH the individual ice cores and indices are better correlated. The SH IVI is again highly correlated with all indices and individual ice cores but not with high-frequency temperature records. For both hemispheres the Southern Oscillation index shows no significant correlation with the volcanic indices, ice cores or the IVI, thus providing no evidence for the impact of volcanic eruptions on El Niño/Southern Oscillation events. Bacmeister, J.T., Schoeberl, M.R., Summers, M.E., Rosenfield, J.E., Zhu, X., **Descent of long-lived trace gases in the winter polar vortex,** *Journal of geophysical research,* June 20, 1995, 100(D6), p.11,669-11,684, 31 refs.

Recent observations of CH_4 and HF from the UARS Halogen Limb Occultation Experiment (HALOE) suggest that vigorous descent occurs within the polar winter vortex with "mesospheric" values of CH_4 evident down to 30 mbar. This study shows that a highly accurate two-dimensional model advection scheme coupled with a modern radiation scheme, parameterized planetary and gravity wave drag algorithms can produce tracer distributions consistent with HALOE observations. The modeled tracer distribution within the polar vortex is found to be principally dependent on the strength of dynamical drag in the middle atmosphere and the strength of the planetary wave forcing. However, the strong downward transport of tracers at the poles during winter can be disrupted in midwinter by planetary wave mixing. Thus the weaker planetary wave forcing in the Southern Hemisphere winter allows for a more coherent descent of long-lived tracers from the mesosphere than during the Northern Hemisphere winter. Multiple-year integrations of the model reveal a general circulation of the stratosphere which lofts tracers to mesospheric altitudes. Material removed from the mesosphere returns to the stratosphere principally within the polar regions. (Auth. mod.)

Balsey, B.B., et al, **On the lack of southern hemisphere polar mesophere summer echoes,** *Journal of geophysical research,* June 20, 1995, 100(D6), p.11,685-11,693, 23 refs.

This report presents VHF radar observations of the southern high-latitude mesopause region using wind profilers that were installed recently on King George I., and Ushuaia, Argentina. The observations, which were made during Jan. and Feb. 1993, show almost no evidence of so-called polar mesosphere summer echoes, or PMSE. Since these echoes are a predominant feature of the northern high-latitude mesosphere in summer, their absence in the Southern Hemisphere is both surprising and intriguing. This paper presents evidence demonstrating the virtual absence of the echoes and demonstrates that the systems employed were capable of detecting them had they been present. Also outlined are some of the consequences of this intriguing result, which are supported by observed hemispheric differences in polar mesospheric clouds, mesospheric temperature, upper atmospheric gravity wave activity, and mean circulation patterns. (Auth. mod.)

Gallée, H., ed, **Simulation of the mesocyclonic activity in the Ross Sea, Antarctica,** *Monthly weather review,* July 1995, 123(7), p.2051-2069, 44 refs.

The mesocyclonic activity in the southwestern Ross Sea is examined, with emphasis on its forcing by katabatic winds. The three-dimensional version of the meso-γ-scale primitive equation model Modèle Atmosphérique Régional is used in which a representation of cloud microphysical processes has been introduced. Idealized boundary conditions are prescribed. In particular, the ocean is assumed to be completely ice-free or partially ice-covered. The former case corresponds to a fall situation that coincides with the climatological maximum of estimated precipitation at McMurdo Station on Ross I. Due to the propagation of katabatic winds over the ocean, boundary layer fronts form. Clouds are generated in the fronts. A surface pressure trough also forms and extends northeastward from Terra Nova Bay. Mesocyclones are simulated in the trough. When the ocean is ice-free, strong sensible heat fluxes toward the atmosphere amplify the strength of the trough up to typically observed values. In this case, snow precipitation is associated with the boundary layer fronts and occurs in particular over McMurdo Sound. It is also found that latent heat release due to precipitation formation in the fronts does not significantly affect the deepening of the trough. (Auth. mod.)

Berland, B.S., Haynes, D.R., Foster, K.L., Tolbert, M.A., George, S.M., **Characterization of model polar stratospheric cloud films using laser induced thermal desorption and optical interference techniques,** *SPIE-The International Society for Optical Engineering. Proceedings,* 1994, Vol.2125, Laser techniques for surface science. Edited by H.L. Dai et al, p.31-51, 30 refs.

DLC TA418.7.L36

Optical interference techniques were used to measure the real index of refraction of nitric acid/ice films representative of type I and type II polar stratospheric clouds (PSCs). Possible candidates for type I PSCs include amorphous HNO_3/H_2O mixtures, as well as crystalline nitric acid trihydrate (NAT), dihydrate (NAD), and monohydrate (NAM). Amorphous and crystalline model PSC films were grown in vacuum by vapor deposition on single-crystal Al_2O_3 substrates at low temperatures. The real indices of refraction at λ=632 nm were measured for these films using the time-dependent optical interference during film deposition. The stoichiometries of the HNO_3/H_2O films were determined using laser induced thermal desorption (LITD) techniques. For the amorphous films at 130 K, the refractive indices increased with increasing nitric acid content. The values ranged from n=1.31 for pure ice to n=1.47 for nearly pure nitric acid. A Lorentz-Lorenz analysis was in good agreement with the measured refractive indices of the amorphous HNO_3/H_2O films as a funtion of HNO_3 mole fraction. Growth of HNO_3/H_2O films at 175 K resulted in the formation of either crystalline NAM or NAD. The crystalline indices were substantially higher than their amorphous analogs. (Auth. mod.)

Van Weele, M., Vilà-Gureau de Arellano, J., Kuik, F., **Combined measurements of UV-A actinic flux, UV-A irradiance and global radiation in relation to photodissociation rates,** *Tellus,* July 1995, 47B(3), p.353-364, 26 refs.

At present, photodissociation rates at ground level are mainly estimated from empirical expressions that relate the irradiance ultraviolet A or global (UV-A) to photodissociation rates. In this paper, a comparison is made between the UV-A actinic flux, which is the appropriate radiometric quantity to estimate photodissociation rates, and the two other commonly used radiometric quantities: UV-A irradiance and global radiation. The comparison is based on measurements of the 3 quantities at various locations in the Azores, Antarctica, and the Netherlands. (Auth. mod.)

Gonella, J.A., **Ocean-atmosphere coupling and short term fluctuations of earth rotation,** *Oceanologica acta,* Jan. 1987, 10(1), p.123-127, 21 refs.

Several authors have shown that measurements of fluctuations in length-of-day (l.o.d.) and angular momentum of the atmosphere are strongly correlated; these measurements support the assumption that the entire planet is a closed dynamic system. Accelerations of angular momentum of the atmosphere occur simultaneously with decelerations of the rotation of the solid earth, and vice versa, with l.o.d. change of about one millisecond in an annual period. In this paper, only the minor role of the world ocean is discussed. The southern ocean, which is wind-driven, could make, at the most, a contribution of only a few percent of the total change of l.o.d. In the oceans, phase velocities of barotropic waves range between 2,000 to 20,000 km/day; these large free oceanic waves could act on l.o.d. changes only in the frequency band ranging from 0.1 to 1 cycle per day. On the annual and seasonal scales, it is emphasized that the global water balance within the water cycle (evaporation, condensation, precipitation) could have a larger effect than oceanic circulation on earth-rotation. (Auth. mod.)

Nakamura, N., **Modified Lagrangian-mean diagnostics of the stratospheric polar vortices. Part 1: formulation and analysis of GFDL SKYHI GCM,** *Journal of the atmospheric sciences,* June 1, 1995, 52(11), p.2096-2108, 30 refs.

A two-dimensional diagnostic model of tracer transport in the polar stratospheres is formulated. The model is a generalization of the area analysis method devised by Butchart and Remsberg but uses the mass element enclosed by the contours of a quasi-conservative tracer on a given isentropic surface as a "meridional" coordinate. This modified Lagrangian-mean coordinate is transparent to the advective effects of the winds, and thus unambiguously extracts the nonconservative effects on the tracer distribution. The derived transport equation takes an equivalent advective form; that is, the tracer contours are "advected" by the mean nonconservative mass flow while there are no "eddy flux" contributions. Hence, the mass flux is implied in the motion of the tracer contours. Not only is this model conceptually simple, it is also computationally economical for analyzing large, high-resolution datasets since time averaging can be omitted to define a robust mean field of the tracer. The model is used to diagnose the N_2O mixing ratio and potential vorticity simulated in the high-resolution, Geophysical Fluid Dynamics Laboratory SKYHI GCM. The analysis not only identifies the boundary of the polar vortex better than the Eulerian zonal-mean models but highlights how the nonconservative processes (diabatic heating and friction) contribute to the formation of the vortex edge. (Auth. mod.)

Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992, Hudson, R.D., ed, **Ozone in the troposphere and stratosphere. Part 1,** NASA conference publication 3266, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, 436p. + append., N95-10590, Refs. passim. For selected papers see 49-3001, 49-6287 through 49-6315, or I-52204 and I-53396 through I-53406.

This book contains Part 1 of the papers presented at the 1992 Quadrennial Ozone Symposium held in Charlottesville, VA. Most of the approximately 100 papers did not specify a particular range of latitudes or dealt with low or mid-latitudes but 29 were pertinent to high latitudes, and of those, 11 were pertinent to Antarctica. The papers dealt with global ozone measurements from ground stations, ozonesonde, and satellite; modeling of stratospheric aerosol surface processes; modeling of radiative and temperature effects on global ozone; possible relativistic electron induced ozone depletion; modeling of the effects of emissions from proposed stratospheric aircraft on ozone; effects of the quasi-biennial oscillation on ozone; solar proton effects on ozone; and a general circulation model of global ozone depletion.

Oltmans, S.J., Levy, H., II, **Ozone measurements from a global network of surface sites,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.19-23, N95-10595, 13 refs.

From a network of surface ozone monitoring sites distributed primarily over the Atlantic and Pacific oceans, the seasonal, day-to-day, and diurnal patterns are delineated. At most of the Northern Hemisphere sites there is a spring maximum and late summer or autumn minimum. All the sites in the Southern Hemisphere show winter maxima and summer minima. Air of tropical origin has much lower ozone concentrations than air from higher latitudes. At four of the locations (Barrow, AK; Mauna Loa, HI; American Samoa; and South Pole) there are 15 through 20-year records which allow one to look at longer term changes. At Barrow there has been a large summer increase over the 20 years of measurements. At the South Pole, on the other hand, summer decreases of nearly 25% over the 16 years of measurements have led to a significant overall decline in surface ozone amounts during that period. (Auth. mod.)

London, J., **Long-term observed ozone trends in the free troposphere and lower stratosphere,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.181-185, N95-10633, 11 refs.

The vertical distributions of ozone trends in the free troposphere and lower stratosphere were derived from ozonesonde observations taken over an average period of about 20 years. The results for the annual trends show a consistent pattern of increased ozone of about 1%/yr to 2%/yr up to about 300 mb and decreased ozone of about -0.6%/yr from about 100 to 50 mb. Statistically significant positive trends found in mid-troposphere (about 500 mb) at a set of representative stations in the Northern Hemisphere have little apparent seasonal variation. Negative trends are generally strongest at 50-70 mb with a tendency to be larger during spring. A highly significant negative trend of about -5%/yr is found near 100 mb over Showa Station (69°S) during spring. (Auth.)

Herman, J.R., Stolarski, R.S., McPeters, R., Larko, D., **Global distribution of ozone destruction rates obtained from 13 years of Nimbus/TOMS data (1979-1991),** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.244-148, N95-10649, 17 refs.

Long-term ozone trends (percentage change) have been computed from 13 years of Nimbus/TOMS (Total Ozone Mapping Spectrometer) data as a function of latitude, longitude, and month for the period Jan. 1, 1979 to Dec. 31, 1991. In both hemispheres, the ozone column content has decreased at latitudes above 30° by amounts that are larger than predicted by homogeneous chemistry models for the 13-year time period. The largest rates of ozone decrease occur in the Southern Hemisphere during winter and spring, with recovery during the summer and autumn. The large winter ozone loss rates are consistent with observed low stratospheric temperatures, ice-cloud formation, and heterogeneous chemistry at middle and high latitudes. There are similar, but smaller changes observed in the Northern Hemisphere. At mid-latitudes, there are increased zonal average ozone depletion rates that correspond to 5 geographically localized regions of increased ozone depletion rates. Only the equatorial band between plus or minus 20° shows little or no long-term ozone change since Jan. 1979. The long-term winter ozone depletion rate data for both hemispheres suggests that heterogeneous chemistry processes may operate over a wide range of latitudes during half of the year. (Auth.)

Connell, P.S., Kinnison, D.E., Wuebbles, D.J., Burley, J.D., Johnston, H.S., **Effects of stratospheric aerosol surface processes on the LLNL two-dimensional zonally averaged model,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.302-306, N95-10662, 8 refs.

Heterogeneous chemical processes associated with stratospheric sulfuric acid aerosol are incorporated into the LLNL (Lawrence Livermore National Laboratory), two-dimensional, zonally averaged model of the troposphere and stratosphere. The primary interest is in changes in partitioning within the Cl- and N- families in the lower stratosphere. The heterogeneous hydrolysis reactions $N_2O_5 + H_2O(\text{aerosol}) \rightarrow 2HNO_3(\uparrow)$ and $ClONO_2 + H_2O(\text{aerosol}) \rightarrow HOCl(\uparrow) + HNO_3(\uparrow)$ are considered alone and in combination with the proposed formation of nitrosyl sulfuric acid (NSA) in the aerosol and its reaction with HCl, that is, $HCl + NOHSO_4(\text{aerosol}) \rightarrow ClNO(\uparrow) + H_2SO_4$. Inclusion of these processes produces significant changes in partitioning in the NO_y and ClO_y families in the middle stratosphere. $ClONO_2$ becomes the dominant inorganic Cl-containing species, especially at southern high latitudes. (Auth. mod.)

Karol', I.L., Frol'kis, V.A., **Model evaluation of the radiative and temperature effects of the ozone content changes in the global atmosphere of 1980s,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.338-341, N95-10671, 9 refs.

Radiative and temperature effects of the observed ozone and greenhouse gas atmospheric content changes in 1980-1990 are evaluated using the two-dimensional energy balance radiative-convective model of the zonally and annually averaged troposphere and stratosphere. Calculated radiative flux changes for standard conditions quantitatively agree with their estimates in the WMO/UNEP 1991 review. Model estimates indicate rather small influence of ozone depletion in the lower stratosphere on the greenhouse tropospheric warming rate, being more significant in the non-tropical Southern Hemisphere. The calculated cooling of the lower stratosphere is close to the observed temperature trends there in the last decade. (Auth.)

Aikin, A.C., **Search for relativistic electron induced stratospheric ozone depletion,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.342-346, N95-10672, 12 refs.

Possible ozone changes at 1 mb associated with the time variation and precipitation of relativistic electrons are investigated by examining the Nimbus 7 SBUV ozone data set and corresponding temperatures derived from NMC data. No ozone depletion was observed in high-latitude summer when temperature fluctuations are small. In winter more variation in ozone occurs, but large temperature changes make it difficult to identify specific ozone decreases as being the result of relativistic electron precipitation. No correlation has been found between ozone depletions over Scott Base and the south geomagnetic pole and the solar events studied. (Auth. mod.)

Considine, D.B., Douglass, A.R., **Impact of stratospheric aircraft on calculations of nitric acid trihydrate cloud surface area densities using NMC temperatures and 2D model constituent distributions,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.347-350, N95-10673, 6 refs.

A parametrization of NAT (nitric acid trihydrate) clouds is developed for use in 2D models of the stratosphere. The parametrization uses model distributions of HNO_3 and H_2O to determine critical temperatures for NAT formation as a function of latitude and pressure, based on data from the NMC (National Meteorological Center). The increase in the NAT cloud formation in the presence of a fleet of stratospheric aircraft is also considered. The stratospheric aircraft NO_x and H_2O perturbations result in increased HNO_3 as well as H_2O. This increases the probability of NAT formation substantially, especially if it is assumed that the aircraft perturbations are confined to a corridor region. The north polar occurrence probability of NAT clouds at the 90 mb surface peaks in December/January. The south polar occurrence probability peaks in August, and is large in both July and September. Probabilities at the 50 mb surface remain about the same in the northern and southern polar regions. (Auth. mod.)

Natarajan, M., Callis, L.B., Boughner, R.E., Lambeth, J.D., **Impact of stratospheric aircraft emissions on ozone: a two dimensional model study,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.367-369, N95-10678, 6 refs.

Atmospheric perturbations caused by the emission of nitrogen oxides from a projected fleet of stratospheric aircraft are studied with a two-dimensional chemistry transport model. Photochemistry of the lower stratosphere, the region where these aircraft may fly, is now known to be influenced by heterogeneous reactions involving sulfuric acid aerosols. This study examines the sensitivity of the atmospheric effects of aircraft to heterogeneous reactions. It is found that heterogeneous reactions make the lower stratospheric ozone less sensitive to perturbations in the odd nitrogen level. The calculated reduction in global ozone due to NO_x injection from a fleet of Mach 2.4 aircraft is 1.28% if gas phase reactions only are considered in the model, and 0.06% if heterogeneous reactions are included. In the high latitude Southern Hemisphere, ozone reductions of 0.8% are seen. (Auth. mod.)

Gruzdev, A.N., Mokhov, I.I., **Quasi-biennial oscillation in total ozone: global behaviour derived from ground-based measurements,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.397-400, N95-10686, 8 refs.

The quasi-biennial oscillation (QBO) in total ozone (TO) is studied on the basis of TO measurements at the world ground-based ozone network during 1972-1988. The TO content is on the whole greater in the tropical belt and smaller in high latitudes during the westerly phase of the QBO of the equatorial stratospheric 50 mb wind than during the easterly phase in all seasons. The appropriate TO difference (westerly category minus easterly category) displays certain space structures changing during a year. There are regions with the peculiar annual evolution of this difference, particularly in the Arctic and Antarctic. Different regimes of the TO QBO in the Southern Hemisphere middle and polar latitudes are due to dynamical isolation of the antarctic stratosphere during the period of the winter circumpolar vortex. The spring reversal of stratospheric circulation which supplies the SH polar region with ozone causes the spring TO minimum over the Antarctic during that period. (Auth. mod.)

Stephenson, J.A.E., Scourfield, M.W.J., **Solar proton effects on austral ozone during the final months of 1989,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.405-408, N95-10688, 9 refs.

Intense solar activity during 1989 prompted six major particle events. Four of these occurred between August and December. Energetic solar protons are a natural source of ozone depletion due to the nitric oxides they produce in the polar atmospheres. In particular, modeling of an event that peaked on Oct. 20 (with >10 MeV proton flux of 73,000 particles $cm^{-2}s^{-1}ster^{-1}$) yields 55% column density enhancements of NO over the southern polar cap. An increase in the spatial extent of the August to December 1989 ozone hole over a region extending from 90°S to 70°S, compared to previous years of moderate solar activity (1984 to 1988), was detected. The enhancement of NO_x concentrations due to SPE's (solar proton events) may be seen as a likely source to increase the probability of NAT PSC (nitric acid trihydrate polar stratospheric cloud) formation. However, the addition of NO_x may in some instances result in larger ice particles rather than increasing the area of coverage of PSCs. In addition, extra odd nitrogen will have no effect in regions where processing of ozone is complete. (Auth. mod.)

I-53406

Dudek, M.P., Wang, Y.C., Liang, X.Z., Li, Z., **General circulation model study of the climatic effect of observed stratospheric ozone depletion between 1980 and 1990,** Quadrennial Ozone Symposium, Charlottesville, VA, June 4-13, 1992. Ozone in the troposphere and stratosphere. Part 1. Edited by R.D. Hudson, Greenbelt, MD, U.S. National Aeronautics and Space Administration. Goddard Space Flight Center, 1994, p.433-436, N95-10694, 5 refs.

Satellite measurements have shown a significant reduction in the stratospheric ozone over the middle and high latitudes of both hemispheres between the years 1979 and 1991. Recent studies indicate that the net effect depends not only on latitudes and seasons but also on the response of the lower stratospheric temperature. A general circulation model (GCM) is used to calculate the climatic effect due to stratospheric ozone depletion and compare the effect with that due to observed increases of trace gases CO_2, CH_4, N_2O, and CFCs for the period 1980-1990. In the simulations, the middle and high latitudes in both hemispheres show column ozone losses, while the tropics show a slight increase from February to July. The antarctic ozone hole is evident, with over a 40% reduction in column ozone at the pole in October and November. (Auth. mod.)

Murphy, D.M., Gary, B.L., **Mesoscale temperature fluctuations and polar stratospheric clouds,** *Journal of the atmospheric sciences,* May 15, 1995, 52(10), p.1753-1760, 34 refs.

Remote sensing measurements of temperature fluctuations on isentropic surfaces, as well as *in situ* measurements, are used to show that even high-resolution trajectory calculations seriously underestimate the rate of change of temperature experienced by air parcels. Rapid temperature fluctuations will affect the nucleation of polar stratospheric cloud (PSC) droplets and could promote the formation of metastable phases in PSCs. Mesoscale temperature fluctuations are large enough to produce significant departures from equilibrium in established PSCs. The large cooling rates experienced by air parcels have important implications for denitrification and dehydration: nearly all condensation nuclei should be activated when a PSC is first formed and mass must be redistributed to larger aerosols during the evolution of a PSC if denitrification is to occur. (Auth.)

Trounday, B., Perthuis, L., Strebelle, S., Farrara, J.D., Mechoso, C.R., **Dispersion properties of the flow in the southern stratosphere during winter and spring,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,901-13,917, 18 refs.

The STRATEOLE project, organized by France's Centre National de la Recherche Scientifique, will release a large number of isopycnal balloons to drift in the lower stratosphere of the Southern Hemisphere. In preparation for STRATEOLE this paper studies the structure and dispersion properties of the flow in the lower stratosphere at high southern latitudes during winter and spring. The approach for investigation is based on computing trajectories of fluid parcels and isopycnal balloons using the velocity field obtained on-line during simulations with a three-dimensional primitive-equation model of the stratosphere and mesosphere. A scheme for computation of isopycnal balloon trajectories is devised, and a method for estimating the location of the polar night vortex edge is developed. It is found that trajectories of fluid parcels initiated well inside the vortex remain within the vortex for a period of months. A small number of fluid parcels released near the vortex edge cross the edge with about an equal number of crossings from inside to outside the vortex as from outside to inside. The isopycnal balloons show a stronger tendency to cross the vortex edge than do fluid parcels. (Auth. mod.)

Vömel, H., Oltmans, S.J., Hofmann, D.J., Deshler, T., Rosen, J.M., **Evolution of the dehydration in the antarctic stratospheric vortex,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,919-13,926, 14 refs.

In 1994 an intensive program of balloon-borne frost point measurements was performed at McMurdo. During this program a total of 19 frost point soundings was obtained between Feb. 7 and Oct. 5, which cover a wide range of undisturbed through strongly dehydrated situations. Together with several soundings from Amundsen-Scott Station between 1990 and 1994, they give a comprehensive picture of the general development of the dehydration in the antarctic stratospheric vortex. The period of dehydration typically starts around the middle of June, and a rapid formation of large particles leads to a fast dehydration of the vortex. The evaporation of falling particles leads to rehydration layers, which have significantly higher water vapor concentrations than the undisturbed stratosphere. Through the formation of these rehydration layers in the early stages of the dehydration, particle fall speed of $\frac{1}{3}$ km/d and thus a mean particle size of 4 µm is estimated. (Auth. mod.)

Luo, M., Cicerone, R.J., Russell, J.M., III, **Analysis of Halogen Occultation Experiment HF versus CH_4 correlation plots: chemistry and transport implications,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,927-13,937, 25 refs.

The relationship between stratospheric CH_4 and hydrogen fluoride (HF) observed simultaneously by the Halogen Occultation Experiment (HALOE) on the Upper Atmosphere Research Satellite (UARS) has been examined globally. The meridional structures of the two long-lived species for the equinox and solstice seasons are found to be similar. Their surfaces of constant mixing ratio, however, are found to not coincide. The isopleth of CH_4 graphed as pressure versus latitude shows a steeper slope than that of HF. This feature can be clearly seen from the scatterplots of CH_4 versus HF for a sequence of latitude regions. In general, CH_4-HF correlation plots are characterized by tightly fitted curves for different latitude bands. A two-dimensional model simulation of CH_4 and HF agrees well with HALOE observations, and shows that the altitude-latitude dependences of CH_4 removal and HF production rates play an important role in determining global CH_4-HF correlations. It is found that the CH_4-HF correlation inside the antarctic vortex is nearly linear and is shifted from that of outside the vortex and from that of polar late-summer before the formation of the vortex. The obvious shift of HF values on CH_4 surfaces or vice versa is usually found across dynamical barriers. (Auth. mod.)

Eckman, R.S., et al, **Stratospheric trace constituents simulated by a three-dimensional general circulation model: comparison with UARS data,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,951-13,966, 50 refs.

Constituent distributions are presented from the NASA Langley three-dimensional general circulation model, incorporating a comprehensive-chemistry scheme. A 7-year gas phase model simulation was performed to investigate long-term model stability. In addition, a 1-year simulation was made using parameterized polar heterogeneous processes and reactions occurring on sulfate aerosols. The results of these simulations are compared with species climatologies and with satellite data sets in order to characterize and evaluate model performance and identify aspects of the chemical scheme requiring improvement. The agreement between the modeled seasonal variation of total ozone and the measurement climatologies is satisfactory but shows some differences with respect to the depth and persistence of the southern springtime ozone depletion. (Auth. mod.)

Douglass, A.R., et al, **Interhemispheric differences in springtime production of HCl and $ClONO_2$ in the polar vortices,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,967-13,978, 29 refs.

Upper Atmospheric Research Satellite observations of O_3 and ClO (Microwave Limb Sounder), $ClONO_2$ and HNO_3 (Cryogenic Array Etalon Spectrometer), NO, NO_2, and HCl (Halogen Occultation Experiment), and model calculations are used to produce an exposition of the different processes through which the reservoir gases $ClONO_2$ and HCl are reformed at the end of the polar winter. Comparison of the observations within the polar vortices shows that HCl increases more rapidly in the antarctic vortex in spring than in the arctic vortex. Model analysis shows that this occurs because the O_3 concentrations in the southern vortex fall well below those in the northern vortex. The Cl/ClO fraction calculated for the Southern Hemisphere is therefore up to 30 times higher, leading to rapid HCl formation by Cl + CH_4. The concentrations of NO observed by HALOE are substantially lower for the Northern Hemisphere than for the Southern Hemisphere, even for similar values of the concentration of HNO_3 and the production of NO_x from HNO_3 through photolysis and reaction with OH. This is consistent with the dependence of the NO/NO_x ratio on the O_3 concentration, i.e., the daytime production rate of NO_2 via NO + O_3 is reduced, leading to higher NO in the Southern Hemisphere. (Auth. mod.)

De Zafra, R.L., Reeves, J.M., Shindell, D.T., **Chlorine monoxide in the antarctic spring vortex. 1. Evolution of midday vertical profiles over McMurdo Station, 1993,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.13,999-14,007, 18 refs.

A prolonged record of emission spectra from chlorine monoxide in the vicinity of McMurdo Station during formation of the austral spring ozone hole of 1993 has been obtained. These spectra were processed to obtain vertical mixing ratio profiles by deconvolution of pressure-broadened line shapes. The resulting profiles give a detailed evolution for both altitude distribution and mixing ratio of ClO during development of a major ozone hole event. In early September, very strong emission was observed from pressure-broadened low-altitude ClO. A brief significant decrease in ClO content occurred in late September when the inner vortex edge approached McMurdo, signifying that a strong gradient in ClO exists near the inner vortex edge. A rapid and apparently final deactivation of chlorine in the lower stratosphere was observed to start about Oct. 1-2. The findings of initially large values of ClO well above 20 km are consistent with observation of polar stratospheric cloud formation in this range during the austral winter of 1993, and with observations showing increased ozone depletion above 20 km relative to previous years. (Auth. mod.)

Martinerie, P., Brasseur, G.P., Granier, C., **Chemical composition of ancient atmospheres: a model study constrained by ice core data,** *Journal of geophysical research,* July 20, 1995, 100(D7), p.14,291-14,304, 77 refs.

A coupled chemistry radiation transport two-dimensional model of the lower and middle atmosphere was adapted to study the chemical composition of the atmosphere at preindustrial time and last glacial maximum (LGM). The model was constrained by trace gas concentrations (CO_2, CH_4, and H_2O) inferred from polar ice core records. The formulation of tropospheric dynamics and chemistry was improved in order to more accurately simulate the transport and the oxidation processes below the tropopause. The objectives are to infer the changes in middle-atmosphere temperature, ozone layer, and oxidation capacity of the atmosphere (e.g., methane lifetime) over the last 18,000 years. A middle-atmosphere cooling was obtained between LGM and preindustrial Holocene (PIH) as well as between PIH and present time, mainly due to changes in the CO_2 and chlorofluorocarbon (CFC) concentrations, respectively. Between LGM and PIH the compensating effects of CO_2 and N_2O lead to little variation in stratospheric ozone. The corresponding changes in the methane sink are too small to have played a dominant role in the past methane concentration changes. The model-derived methane emissions for LGM, PIH, and present time are in good agreement with methane sources evaluated during these three periods. (Auth. mod.)

Ramachandran, T.V., Sathe, A.P., Joshi, P.V., Balani, M.C., **Summary of environmental study carried out by Bhabha Atomic Research Centre during 8th, 9th and 10th summer Indian expeditions to Antarctica,** *India. Atomic Energy Commission. Bhabha Atomic Research Centre. Technical report,* 1994, BARC-1994/E/003, 37p., DE95-608072, Refs. p.30-32.

The Bhabha Atomic Research Centre has participated in the 8th, 9th and 10th summer expeditions to Antarctica during the 1988-91 season to carry out background radiation surveys and to collect representative samples for radioactivity and heavy metal analyses. Spot measurements of ions as well as radon daughter radionuclides were also carried out during the expeditions. Radon levels as well as heavy metal pollutant concentrations have been found to be quite low in general; however higher levels were observed at places where human activity is concentrated around the landing area and the laboratory site. (Auth. mod.)

Emmons, L.K., **Measurement and analysis of polar stratospheric ClO and N_2O by ground-based mm-wave spectroscopy,** Stony Brook, State University of New York, 1994, 139p., University Microfilms order 94-33182, Ph.D. thesis. Refs. p.130-139.

Analysis and interpretation of measured spectra of spring-time stratospheric ClO and N_2O made at McMurdo Station during Sep. and Oct. in 1992, and at Thule Air Base, Greenland, during Feb. and Mar. 1992 and 1993, using a ground-based mm-wave receiver, are presented. Measurements of ClO, a direct product of ozone destruction, were made through the evolution of the antarctic ozone hole. The emission spectrum of ClO at 278.632 GHz was observed and vertical profiles have been determined from measurements both inside and outside the polar vortex; a sharp difference is seen between them. Comparisons are made to coincident balloon and satellite measurements of ozone, and ground-based measurements of N_2O. The diurnal variation of the low altitude layer of ClO present in the antarctic ozone hole has also been measured. The mixing ratio increases after sunrise, from less than 0.1 ppbv just before sunrise to about 1.5 ppbv at midday, and decreases with increasing solar zenith angle after midday. This diurnal record is unique and is valuable for the validation of photochemical models of the polar stratosphere. N_2O is a good tracer of stratospheric dynamics, having only ground sources and a long chemical lifetime in the atmosphere. Correlations with coincident ozonesonde measurements show no indication of appreciable ozone depletion during this period. (Auth. mod.)

Carslaw, K.S., Luo, B.P., Peter, T., **Analytic expression for the composition of aqueous HNO_3-H_2SO_4 stratospheric aerosols including gas phase removal of HNO_3,** *Geophysical research letters,* July 15, 1995, 22(14), p.1877-1880, 10 refs.

The recognition that stratospheric aerosols may remain liquid at polar winter temperatures leads to a need for reliable methods of estimating the aerosol composition, both for the interpretation of particle observations and for use within stratospheric chemical models. This paper presents an analytic expression for the composition of ternary aerosols and the gaseous HNO_3 concentration in terms of the temperature and total amounts of H_2SO_4, HNO_3 and H_2O, based upon the thermodynamic model of Carslaw et al. (1995). (Auth. mod.)

Seckmeyer, G., et al, **Geographical differences in the UV measured by intercompared spectroradiometers,** *Geophysical research letters,* July 15, 1995, 22(14), p.1889-1892, 8 refs.

Five UV spectroradiometers representative of the types used in monitoring programs on several continents were intercompared at the Fraunhofer Institute for Atmospheric Environmental Research (IFU), Garmisch-Partenkirchen, Germany, during a campaign in Aug. 1994. Global spectral irradiances between 290 and 410 nm were measured over a range of solar zenith angles from 30° to 80°. Scans were synchronized to enable useful comparisons to be made under changing weather conditions, which included overcast, partly cloudy, and clear skies. No exchange of data was allowed between participating groups until after the campaign. At wavelengths longer than 310 nm, the spectra generally agreed to within ±5%. At wavelengths shorter than 310 nm, differences between instruments were larger, especially at larger solar zenith angles. Causes of differences are discussed. UV doses measured at sites in the Southern Hemisphere are systematically larger than those measured at the corresponding northern latitudes. During the summer months the daily doses at the South Pole exceed those at mid-latitudes in the Northern Hemisphere. (Auth. mod.)

Ricaud, P.D., et al, **Polar stratospheric clouds as deduced from MLS and CLAES measurements,** *Geophysical research letters,* Aug. 1, 1995, 22(15), p.2033-2036, 18 refs.

From Aug. 30, 1992 to Sep. 3, 1992 a supersaturated area at 465 K potential temperature is deduced from Microwave Limb Sounder water vapor measurements over western Antarctica, where high extinction coefficients measured by spectrometry indicate polar stratospheric clouds (PSCs). These PSCs are attributed partly to the effect of an anticyclone located over South America and partly to localized orographic waves, which raise the isentropes and generate rapid adiabatic cooling. A local minimum in column O_3 is observed in this area, which is believed to be a consequence of the dynamics. Enhanced ClO abundances downstream of the region indicate PSC processing and chlorine activation. (Auth. mod.)

Adolphs, U., Wendler, G., **Pilot study on the interactions between katabatic winds and polynyas at the Adélie Coast, eastern Antarctica,** *Antarctic science,* Sep. 1995, 7(3), p.307-314, Refs. p.313-314.

Infrared satellite images of the coastal area off Adélie Land were examined together with two wind data sets, one from the Dumont d'Urville Station, the other from an Automated Weather Station during the 1986 winter. A correlation between the development of open water areas (polynyas) and the appearance of extremely strong offshore winds can be drawn. The wind direction tended to be more perpendicular to the coastline during these extreme 'events', suggesting a katabatic origin of the increase in wind strength. In the study area the influence of the katabatic wind on the sea ice extends 20-100 km offshore. Sea ice motion further off the coast seems to be more dominated by synoptic-scale weather systems. Broader scale atmospheric influences may create large polynyas which influence the development of coastal winds, as the temperature contrast between open water and the cold continent generates its own circulation. Strong wind events can have a weakening effect on the coastal sea ice which can lead to a much more sensitive reaction of the sea ice in response to following anomalous wind events. (Auth.)

Turner, J., Lachlan-Cope, T.A., Thomas, J.P., Colwell, S.R., **Synoptic origins of precipitation over the Antarctic Peninsula,** *Antarctic science,* Sep. 1995, 7(3), p.327-337, 16 refs.

The synoptic origins of precipitation on the western side of the Antarctic Peninsula over the one year period Mar. 1992 to Feb. 1993 are investigated using meteorological observations, satellite imagery and analyses produced by the UK Meteorological Office. Precipitation at Rothera Station was found to occur at 30% of the synoptic reporting time with 80% of precipitation reports being associated with cyclonic disturbances. Although three quarters of all precipitation reports were for snow, the proximity of Rothera to the zone of maximum cyclonic activity meant that incursions of mild air produced rain in all seasons. During the year 95% of all precipitation was classed as slight. Variability of precipitation on the intraseasonal timescale was highly dependent on the synoptic-scale circulation. The most common synoptic situation for precipitation was a frontal cyclone over the Bellingshausen Sea which accounted for 38% of all precipitation events and 62% of the moderate and heavy precipitation reports. Of the extra-tropical cyclones that gave precipitation 49% were found to have developed south of 60°S. (Auth. mod.)

Bevilacqua, R.M., et al, **Polar Ozone and Aerosol Measurement experiment (POAM II),** *SPIE—The International Society for Optical Engineering. Proceedings,* 1994, Vol.2266, Optical Spectroscopic Techniques and Instrumentation for Atmospheric and Space Research, San Diego, California, 25-27 July, 1994. Edited by J.X. Wang and P.B. Hays, p.374-382.

DLC QC450.O67

The Polar Ozone and Aerosol Measurement experiment (POAM II) was launched on the SPOT 3 satellite on Sep. 25, 1993. POAM II is designed to measure the vertical profiles of the polar ozone, aerosols, water vapor, nitrogen dioxide, atmospheric density and temperature in the stratosphere and upper troposphere. It makes solar occultation measurements in nine channels defined by narrowband filters. The field of view is 0.01 by 1.2°, with an instantaneous vertical resolution of 0.6 km at the tangent point in the earth's atmosphere. The SPOT 3 satellite is in a 98.7° inclined sun-synchronous orbit at an altitude of 833 km. From the measured transmissions, it is possible to determine the density profiles of aerosols, O_3, H_2O, and NO_2. Using the assumption of uniformly mixed oxygen, one is also able to determine the temperature. The authors present details of the POAM II instrument design, including the optical configuration, electronics and measurement accuracy. They also present preliminary results from the occultation measurements made to date. (Auth.)

Peckham, G.E., et al, **Atmospheric composition measurements by the Microwave Limb Sounder (MLS) on the Upper Atmosphere Research Satellite,** International Geoscience and Remote Sensing Symposium, Firenze (Florence), Italy, July 10-14, 1995. IGARSS'95. Quantitative remote sensing for science and applications. Vol.1, New York, Institute of Electrical and Electronics Engineers, 1995, p.429-431, 22 refs.

The Microwave Limb Sounder (MLS) has monitored the composition of the stratosphere and lower mesosphere for more than three years since its launch on the Upper Atmosphere Research Satellite in Sep. 1991. The MLS measures thermal emission from the atmospheric limb at millimeter wavelengths and is the first limb sounder to operate at these wavelengths from space. Major results to date are summarized. The depletion of ozone in the antarctic spring is illustrated with maps for 1991, '92 and '93. Maps for the Arctic are compared with corresponding maps for the Antarctic. A significant decrease in gaseous HNO_3 has been observed in the antarctic vortex. Water vapor fields used as tracers illustrate dynamical features of the winter polar vortices. (Auth. mod.)

Miao, J.G., Markus, T., Burns, B.A., **Retrieval of temperature profiles over sea ice with multisensor analysis: combination of the DMSP's SSM/I, OLS, and SSM/T1 sensors,** International Geoscience and Remote Sensing Symposium, Firenze (Florence), Italy, July 10-14, 1995. IGARSS'95. Quantitative remote sensing for science and applications. Vol.2, New York, Institute of Electrical and Electronics Engineers, 1995, p.1142-1144, 6 refs.

In polar regions the surface conditions are complex, with mixtures of open water and different types of ice having different emissivities and coverage in the footprints of Special Sensor Microwave Temperature (SSM/T1.) In this paper the authors have combined SSM/T1 data with coincident data from the Special Sensor Microwave Imager (SSM/I) and the Operational Linescan System (OLS) to get surface information, specifically ice concentration and surface temperature, from which the emissivities of open water and two ice types at a frequency of 50.5 GHz are estimated. The temperature retrieval algorithm is based on the constrained linear inversion method. Temperature profiles are retrieved for the Weddell Sea region during July 1992, and compared to radiosonde data from the German research vessel *Polarstern.* The results show that multisensor retrieval on the average gives a 1°K (rms) improvement in the lower troposphere ($h<5$ km). Chen, B., Bromwich, D.H., Hines, K.M., Pan, X.G., **Simulations of the 1979-88 polar climates by global climate models,** *Annals of glaciology,* 1995, Vol.21, International Symposium on the Role of the Cryosphere in Global Change, Columbus, OH, Aug. 7-12, 1994. Proceedings. Edited by D.A. Rothrock, p.83-90, 18 refs.

Simulation of the northern and southern polar climates for 1979-88 by 14 global climate models (GCMs), using the observed monthly averaged sea-surface temperatures and sea-ice extents as boundary conditions, is part of an international effort to determine the systematic errors of atmospheric models under realistic conditions, the so-called Atmospheric Model Intercomparison Project (AMIP). In this study, intercomparison of the models' simulation of polar climate is discussed in terms of selected surface and vertically integrated monthly averaged quantities, such as sea-level pressure, cloudiness, precipitable water, precipitation and evaporation/sublimation. The results suggest that the accuracy of model-simulated climate features in high latitudes primarily depends on the horizontal resolution and the treatment of physical processes in the GCMs. AMIP offers an unprecedented opportunity for the comprehensive evaluation and validation of current atmospheric models and provides valuable information for model improvement. Bromwich, D.H., Chen, B., Tzeng, R.Y., **Arctic and antarctic precipitation simulations produced by the NCAR community climate models,** *Annals of glaciology,* 1995, Vol.21, International Symposium on the Role of the Cryosphere in Global Change, Columbus, OH, Aug. 7-12, 1994. Proceedings. Edited by D.A. Rothrock, p.117-122, 15 refs.

Precipitation predictions from global-climate models (GCMs) for the ice-covered Arctic Ocean and the ice sheets of Antarctica are among the most important aspects of the inferred response of the polar areas to climate change. The present-day atmospheric-moisture budget poleward of 70 latitude in both hemispheres, as represented by two versions of the NCAR (U.S. National Center for Atmospheric Research) community climate model (CCM1 and CCM2), is compared with observational analyses. The quantities examined on the seasonal and annual time-scales are precipitation, evaporation/sublimation and atmospheric poleward moisture transport. The results are discussed in terms of the physiographic and climatic characteristics of both polar regions and of how the particular models handle moisture transport; CCM1 uses the positive-moisture fixer and CCM2 the semi-Lagrangian transport. A particularly important test both for models and for observations is the degree to which the independently determined moisture-budget quantities actually balance. Deficiencies of both observations and models are discussed. (Auth. mod.)

Budd, W.F., Reid, P.A., Minty, L.J., **Antarctic moisture flux and net accumulation from global atmospheric analyses,** *Annals of glaciology,* 1995, Vol.21, International Symposium on the Role of the Cryosphere in Global Change, Columbus, OH, Aug. 7-12, 1994. Proceedings. Edited by D.A. Rothrock, p.149-156, 29 refs.

Previous attempts to derive the antarctic surface net accumulation distribution from atmospheric-moisture fluxes, in reasonable agreement with the observed distribution, have encountered many difficulties. The present analysis uses the Australian Bureau of Meteorology Global Atmospheric Assimilation and Prediction Scheme (GASP), which has been operational since 1989, to derive the net air-mass and moisture fluxes over the Antarctic. It is shown that the annual mean net surface accumulation closely resembles the glaciologically observed distribution and provides a physical basis for the observed pattern, through the moisture transports. The variations with latitude and elevation and through the annual cycle are also well reproduced. Although some mass-closure errors still exist, they are expected to become insignificant with the new generation of improved analysis schemes. Consequently, the atmospheric analyses can provide a sound basis for both assessing the performance of global climate models in simulating antarctic accumulation rates and monitoring long-term changes which may occur with global warming. Ito, T., **Nature and origin of antarctic submicron aerosols,** Ice core studies of global biogeochemical cycles. North Atlantic Treaty Organization. Advanced Science Institutes. NATO ASI Series I, Vol.30. Edited by R.J. Delmas, Berlin, Springer-Verlag, 1995, p.23-38, 28 refs.

The phenomenological behavior of submicron aerosols in the antarctic atmosphere is summarized and discussed in relation with their significance in aerosol processes in Antarctica. It is inferred that two types of aerosols with different histories are important in the antarctic troposphere. The intrusion of maritime air during the cyclonic storms that occur mostly during cold months causes sea-salt particles and aged sulfate particles, originally contained in the clean maritime air, to dominate the aerosols; on the other hand, during warm months, aerosols in the chemical form of sulfuric acid are predominant. These sulfuric acid aerosols are formed by photochemical oxidation of sulfur-bearing gases in the sunlit troposphere over Antarctica, although the detailed process of the aerosol formation is still an open question. (Auth.)

Peel, D.A., **Chemistry and climatic role of biogenic sulfur: group discussion,** Ice core studies of global biogeochemical cycles. North Atlantic Treaty Organization. Advanced Science Institutes. NATO ASI Series I, Vol.30. Edited by R.J. Delmas, Berlin, Springer-Verlag, 1995, p.167-173, 15 refs.

The discussion leads to the following conclusions: that the ocean-atmosphere sulfur cycle is highly sensitive to climate change on both sub-decadal and glacial-interglacial time-scales; that the nss-SO_4^{2-} deposition over coastal and central areas of Antarctica is primarily a result of oceanic sulfurous emissions, mainly of DMS; that there were much higher concentrations of MSA (methlysulphonic acid) in central Antarctica during the last glacial maximum and by contrast, seemingly lower concentrations over NE Greenland; that there is a much stronger seasonality of MSA near the coast in Antarctica, compared with inland; that the MSA/nss-SO_4^{2-} fraction is higher in coastal parts of Antarctica and also generally higher during climatically warm periods in Antarctica; and that MSA can migrate in ice cores, especially where it is relatively warm, and in these cases can disturb the preserved seasonal signal.

Brown, W.O.J., Fraser, G.J., Fukao, S., Yamamoto, M., **Spaced antenna and interferometric velocity measurements with MF and VHF radars,** *Radio science,* July/Aug. 1995, 30(4), p.1281-1292, 28 refs.

Spaced antenna and interferometry techniques are applied to data collected on two MF radars, at Christchurch, New Zealand, and at Scott Base, and one VHF radar, the MU radar at Shigaraki, Japan. Velocity results are compared as functions of characteristics such as the temporal scale and anisotropy of the scatter. In general, there was good agreement between the two techniques; however, when the temporal scale is small indicating turbulent scatter, there was less agreement. The interferometry technique did not appear to be influenced greatly by anisotropy in the scatter. However, it was affected by averaging of the Doppler spectra and by the use of an extra receiver. It is suggested that less averaging of the spectra results in increased random noise components in the spectra, which in the phase spectra are interpreted as scattering from a greater range of zenith angles. The use of three receivers rather than four also led to scattering that appeared to originate from a greater range of zenith angles. These effects led to lower interferometric velocity estimates that are more biased towards full correlation analysis (FCA) true velocities. (Auth. mod.)

Tokioka, T., **Climate changes predicted by climate models for the increase of greenhouse gases,** *Progress in nuclear energy,* 1995, Vol.29 (Supplement), International Symposium on Global Environment and Nuclear Energy Systems, Susono Shizuoka, Japan, Oct. 24-27, 1994, edited by A. Shimizu, p.151-158, 11 refs.

Climate models have been used to predict climate changes caused by the increase of greenhouse gases. Models predict physical states of the upper part of the earth including the atmosphere, the ocean, the land surface and the cryosphere with the use of physical laws. When the atmospheric concentration of CO_2 is doubled, globally averaged surface temperature is predicted to increase 1.5 to 4.5°C. Temperature increase is most dominant in winter in high latitudes due mainly to sea ice-albedo and snow-albedo feedbacks. Geographically, it is dominant over continents in high latitudes. The hydrological cycle is activated; precipitation is divided into two types, i.e., precipitation from cumuliform clouds and that from stratiform clouds. The former (latter) type increases (decreases) in a globally averaged sense. Therefore the precipitating area decreases while the precipitation amount increases. In summer, many models predict a decrease in soil moisture in mid-latitudes. When atmospheric CO_2 concentration increases at the compound rate of 1% per year, the globally averaged surface temperature increase is about 60% of the equilibrium value, i.e., 0.9-2.7°C. The remaining 40% is for potential future increase. (Auth. mod.)

Jones, P.D., Limbert, D.W.S., **Antarctic surface temperature and pressure data,** *Oak Ridge National Laboratory,* Sep. 1989, ORNL/CDIAC-27NDP-032, Carbon Dioxide Information Analysis Center. Environmental Sciences Division Publication No.3215, 29p. + appendix, Refs. passim.

This document presents monthly mean surface temperature and pressure data from 30 antarctic stations. These data were assembled primarily from *World Weather Records* volumes for 1951-1960 and 1961-1979 and from *Monthly Climatic Data for the World* records since 1961. The periods of record vary by station. The earliest data are from 1903, the most recent from 1988. Data were assessed for quality and for long-term homogeneity through the use of interstation comparison techniques. These data are available free of charge as a numeric data package (NDP) from the Carbon Dioxide Information Analysis Center. The NDP consists of this document and a magnetic tape containing machine-readable data files. This document provides tabular listings of the temperature and pressure data, describes how the data were processed, defines limitations and restrictions of the data, and provides reprints of pertinent literature. Manney, G.L., Zurek, R.W., Froidevaux, L., Waters, J.W., O'Neill, A., Swinbank, R., **Lagrangian transport calculations using UARS data. Part II: ozone,** *Journal of the atmospheric sciences,* Sep. 1, 1995, 52(17), p.3069-3081, 22 refs.

Trajectory calculations are used to examine ozone transport in the polar winter stratosphere during periods of the Upper Atmosphere Research Satellite (UARS) observations. The value of these calculations for determining mass transport was demonstrated previously using UARS observations of long-lived tracers. In the middle stratosphere, the overall ozone behavior observed by the Microwave Limb Sounder in the polar vortex is reproduced by this purely dynamical model. Calculations show the evolution of ozone in the lower stratosphere during early winter to be dominated by dynamics in Dec. 1992 in the Arctic. Calculations for June 1992 in the Antarctic show evidence of chemical ozone destruction and indicate that ca. 50% of the chemical destruction may be masked by dynamical effects, mainly diabatic descent, which bring higher ozone into the lower-stratospheric vortex. Estimating differences between calculated and observed fields suggests that dynamical changes masked ca. 20-35% of chemical ozone loss during late Feb. and early Mar. 1993 in the Arctic. (Auth. mod.)

Pitari, G., Visconti, G., **Possible effects of CO_2 increase on the high-speed civil transport impact on ozone,** *Journal of geophysical research,* Aug. 20, 1995, 99(D8), p.16,879-16,896, 24 refs.

An attempt is made to model the effects of the carbon dioxide increase which is predicted in the future atmosphere when HSCT (high speed civil transport) should be operational. For this purpose a three-dimensional model is used first for the radiative and dynamical calculations followed by a photochemical two-dimensional model including an explicit gas-particle interaction in the process of aerosol formation. The denoxification and denitrification associated with the formation of nitric acid trihydrate (NAT) aerosols significantly affect the partition of chemical families. The radiative perturbation introduced by the CO_2 increase perturbs the stratospheric dynamics such that the lower stratospheric residual circulation is enhanced. This reduces by about 15% the stratospheric residence time of odd nitrogen injected by the aircraft, so that the overall perturbation of stratospheric chemistry due to HSCT is mitigated with respect to the reference case in which CO_2 is kept at the present level. Numerous graphs and several text passages refer to the high latitudes of the Southern Hemisphere. (Auth. mod.)

Kane, R.P., **Total ozone trends in the Southern Hemisphere: an update,** *Revista brasileira de geofísica,* Dec. 1993, 11(2), p.223-231, With Portuguese summary. 20 refs.

In this note, the authors examine the total ozone variations at several latitudes in the Southern Hemisphere, including Showa Station. The largest variation of total ozone is seasonal, which at middle latitudes can be as large as 30% decrease from spring to autumn. The next important variation is the quasi-biennal oscillation which is irregular and can have a range of 0-10%. The long-term variation (decrease) is comparatively small, only about 2-3% from 1980 onwards up to 1987, after which a rising tendency is indicated, after allowing for data inaccuracies. As a health hazard, the seasonal variation would be most dangerous, specially from spring to summer, between 10 AM and 3 PM. (Auth. mod.)

Zheng, X.D., Zhou, X.J., Lu, L.H., Guo, S., **Observational study of the 93 "Ozone Hole" at Zhongshan Station, Antarctica,** *Chinese science bulletin,* July 1995, 40(13), p.1106-1109, 4 refs.

Measurements of O_3, UV-B and NO_2 with a Brewer ozone-spectrophotometer were carried out at Zhongshan Station during the 9th CHINARE program (1992-93). The data of total column ozone abundance from the Brewer, compared with the TOVS data, and the dose rate of noontime biologically UV-B (290-325 nm) radiation at Zhongshan are presented in this note. An outline of the 1993 ozone hole and its impact on enhancing the penetration of UV-B radiation at Zhongshan is presented. (Auth. mod.)

Saxena, V.K., Anderson, J., Lin, N.H., **Changes in antarctic stratospheric aerosol characteristics due to volcanic eruptions as monitored by the Stratospheric Aerosol and Gas Experiment II satellite,** *Journal of geophysical research,* Aug. 20, 1995, 100(D8), p.16,735-16,751, 54 refs.

The objectives of this study are (1) to use Stratospheric Aerosol and Gas Experiment II (SAGE II)-based extinction measurements to study and identify the Mount Pinatubo volcanic aerosol plume within and in the vicinity of the antarctic vortex and to investigate the associated implications of ozone depletion during the austral spring of 1991, and (2) to use the known characteristics of the volcanic aerosol as a tracer for investigating the south polar transport across the vortex edge and stratospheric-tropospheric exchange and to compute estimates of sedimentation velocities and deposition fluxes of the Pinatubo aerosol. Ground truth measurements in the form of analyzing precipitation samples and shallow snow pits collected from the Marr Ice Piedmont on Palmer Peninsula have begun and will continue through the austral spring of 1996. (Auth. mod.)

Egger, J., **Antarctic slope winds and the polar stratospheric vortex,** *Journal of atmospheric and terrestrial physics,* July 1994, 56(9), p.1067-1072, 16 refs.

A wave mean-flow interaction model is used to investigate the coupling of the antarctic slope winds and the polar vortex in the lower stratosphere in winter. The model is restricted to the antarctic domain but synoptic waves of fixed frequency and zonal wavenumber can be prescribed at the northern boundary. They represent southward moving midlatitude perturbations. Cooling at the slope of the antarctic continent induces southeasterly flow near the surface which acts as a source of westerly angular momentum to the atmosphere. The momentum so generated must be transported out of the antarctic domain by these synoptic waves. It is found that the polar vortex is intense in the troposphere and lower stratosphere, and that the slope winds are weak when these waves are ineffective in transporting angular momentum. On the other hand, if the momentum transport is sufficiently strong, the polar vortex is relatively weak and the slope winds are vigorous. (Auth. mod.)

Booth, C.R., Lucas, T.B., Morrow, J.H., **High-resolution ultraviolet spectral irradiance monitoring program in polar regions: six years (and growing) of data available to polar researchers in ozone and ultraviolet related studies,** *Antarctic journal of the United States,* 1993, 28(5), p.338-341, Refs. p. 340-341.

The Antarctic Ultraviolet Spectroradiometer Monitoring Network was established by the U.S. National Science Foundation (NSF) in 1988 in response to predictions of increased ultraviolet (UV) radiation in the polar regions. The network consists of several automated, high-resolution spectroradiometers placed in strategic locations in the Antarctic and the Arctic. Spectroradiometers were installed in four locations between Feb. and Nov. 1988, and a fifth instrument was installed at Barrow, AK, in Dec. 1990. A table lists the positions and the period of data referred to in this report for these sites. A figure presents the time course of erythermally weighted irradiance for six sites. The data for the Northern and Southern Hemisphere show the expected seasonal patterns. For this data set, Palmer Station shows the highest exposure, occurring when traces of ozone-depleted air persisted until nearly midsummer.

Karol', I.L., Frol'kis, V.A., Kiselev, A.A., **Radiative-photochemical modeling of the annually averaged composition and temperature of the global atmosphere during the last glacial and interglacial periods,** *Journal of geophysical research,* Apr. 20, 1995, 100(D4), p.7291-7301, 41 refs.

In this model reconstruction, the changes in surface air temperature and tropospheric relative humidity are prescribed, and both dry adiabatic and moist adiabatic lapse rates are used together with several other external estimates of radiative and photochemical parameters for these periods. The considerable reduction of greenhouse gas content in the atmosphere of both glacial and interglacial periods, including about a 50% reduction of stratospheric moisture in the glacial, leads to the warming of the middle and upper stratosphere by about 11 K and 4 K, in the glacial and interglacial periods, respectively. Stratospheric composition is found to be little sensitive to possible large variations of CO and NO_x surface sources. The ozone mixing ratio drops to 10-12 ppbv in the lower troposphere and increases to a maximum 6.0-7.5 ppmv in the 40 to 46 km layer, but remains almost the same as in preindustrial and in 1985 periods in the 20 to 30 km layer. This results in the approximate conservation of total ozone for all four periods considered. (Auth. mod.)

I-53682

Mote, P.W., **Annual cycle of stratospheric water vapor in a general circulation model,** *Journal of geophysical research,* Apr. 20, 1995, 100(D4), p.7363-7379, 57 refs.

The National Center for Atmospheric Research has redesigned its GCM, the Community Climate Model (CCM2), to enable studies of the chemistry and transport of tracers including water vapor. In this study, methane is carried as a tracer and converted to water; this simple chemistry provides an adequate representation of the upper stratospheric water vapor source. The cold temperature bias in the winter polar stratosphere, which the CCM2 shares with other GCMs, produces excessive dehydration in the Southern Hemisphere, but this dry bias can be ameliorated by setting a minimum vapor pressure. The CCM2's water vapor distribution and seasonality compare favorably with observations in many respects, though seasonal variations including the upper stratospheric semiannual oscillation are generally too small. Southern polar dehydration affects mid-latitude water vapor mixing ratios by a few tenths of a part per million, mostly after the demise of the vortex. (Auth. mod.)

Rind, D., Lonergan, P., **Modeled impacts of stratospheric ozone and water vapor perturbations with implications for high-speed civil transport aircraft,** *Journal of geophysical research,* Apr. 20, 1995, 100(D4), p.7381-7396, 21 refs.

Ozone and water vapor perturbations are explored in a series of experiments with the Goddard Institute for Space Studies climate/middle atmosphere model. In the model calculations, varying amounts of ozone and water vapor are manipulated through several regions of the troposphere and stratosphere, including both polar latitudes. The effects of these manipulations are pointed out and described. Overall, the experiments emphasize that stratospheric changes affect tropospheric dynamics in the model; that tropospheric changes can affect stratospheric dynamics, and that tropospheric feedback processes and natural variability are important when assessing the climatic response to aircraft emissions. (Auth. mod.)

Zhang, R.Y., Leu, M.T., Keyser, L.F., **Sulfuric acid monohydrate: formation and heterogeneous chemistry in the stratosphere,** *Journal of geophysical research,* Sep. 20, 1995, 100(D9), p.18,845-18,854, 43 refs.

This study investigates some thermodynamic properties (i.e., freezing/melting points) and heterogeneous chemistry of sulfuric acid monohydrate (SAM, $H_2SO_4 \cdot H_2O$), using a fast flow reactor coupled to a quadrupole mass spectrometer. The freezing point observations of thin liquid sulfuric acid films show that for acid contents between 75 and 85 wt % the monohydrate crystallizes readily at temperatures between 220 and 240 K on a glass substrate. For a constant H_2O partial pressure, lowering the temperature causes SAM to melt when the temperature and water partial pressure conditions are out of its stability regime. The reaction probability measurements indicate that the hydrolysis of N_2O_5 is significantly suppressed owing to the formation of crystalline SAM: the reaction probability on water-rich SAM (with higher relative humidity, or RH) is of the order of 10^{-3} at 210 K and decreases by more than an order of magnitude for the acid-rich form (with lower RH). These reported values on crystalline SAM are much smaller than those on liquid solutions. No enhancement of these reactions is observed in the presence of HCl vapor at the stratospheric concentrations. (Auth. mod.)

Ciais, P., White, J.W.C., Jouzel, J., Petit, J.R., **Origin of present-day antarctic precipitation from surface snow deuterium excess data,** *Journal of geophysical research,* Sep. 20, 1995, 100(D9), p.18,917-18,927, 40 refs.

The deuterium excess (*d*) is defined as a linear combination of the D/H and $^{18}O/^{16}O$ ratios in natural waters. This paper presents an interpretation of deuterium excess data in surface antarctic snow, using an isotopic model to derive information on the origin of present-day antarctic precipitation. The data come from near the coast (D47, Adélie Land) and from inland (South Pole, 1000 km from the sea). The one-dimensional isotopic model belongs to the Rayleigh family but fully accounts for mixed cloud processes between 0°C and -30°C. Modeling *d* in polar snowfalls meets the problem of a large sensitivity to the saturation conditions prevailing at snow formation. Both inland and near the coast, the model can simulate the observed phase between *d* and δ in snow and moisture of subtropical origin (40°-20°S). Results support a distant vapor source for large-scale precipitation delivered to the antarctic continent. (Auth. mod.)

Lou, G.P., **Three-dimensional simulation of nitrous oxide transport and antarctic vortex evolution,** Atlanta, Georgia Institute of Technology, 1994, 123p., University Microfilms order No.DA95-17133, Ph.D. thesis. 49 refs.

This study focuses on three areas: the structure of the stratospheric antarctic vortex and its evolution; the transport of N_2O and dynamical forces that dominate these processes; and the climatology of the N_2O mixing ratio distribution and its driving factors. A 3-dimensional spectra chemical transport model was employed to simulate N_2O processes. The dynamical driving fields are from the UKMO 4-dimensional assimilated data set. UARS CLAES N_2O mixing ratios are used for the N_2O initial conditions. Model results show that the N_2O distribution and transport closely resemble the CLAES measurements. Diagnostic study and model simulation results reveal that large-scale Eulerian mean vertical motion fields are upward inside the vortex and the mean residual circulation vertical velocity is downward. Stefanutti, L., Morandi, M., Del Guasta, M., Godin, S., David, C., **Unusual PSCs observed by lidar in Antarctica,** *Geophysical research letters,* Sep. 1, 1995, 22(17), p.2377-2380, 14 refs.

Polar stratospheric cloud (PSC) measurements by ground-based lidar were carried out at Dumont d'Urville during the years 1989 to 1993. From such measurements it can be seen that there are cases of PSCs that are not consistent with the simplest nitric acid trihydrate (NAT) theories. Several cases of long-lasting, non-depolarizing PSCs were detected at temperatures below or close to the NAT freezing threshold, at about 195°K, suggesting the presence of durable supercooled droplets. PSC cases showing depolarizing (frozen) particles well above the NAT expected threshold are also shown. These results seem to be more consistent with recent laboratory and *in situ* findings, suggesting a close link between sulfate and PSC particles through the HNO_3-H_2O-H_2SO_4 ternary system. Depolarizing "warm" PSCs are also consistent with the laboratory-observed high melting point of the frozen sulfate core, which remains after NAT evaporation. (Auth. mod.)

Vömel, H., Hofmann, D.J., Oltmans, S.J., Harris, J.M., **Evidence for midwinter chemical ozone destruction over Antarctica,** *Geophysical research letters,* Sep. 1, 1995, 22(17), p.2381-2384, 8 refs.

Two ozone profiles obtained over McMurdo Station showed a strong depletion in stratospheric ozone, and a simultaneous profile of water vapor showed the first clear signs of dehydration. The observation of polar stratospheric clouds (PSCs) beginning with the first sounding showing ozone depletion, the indication of rehydration layers which could be a sign for recent dehydration, and trajectory calculations all indicate that the observed low ozone was not the result of transport from lower latitudes. During this time the vortex was strongly distorted, transporting PSC-processed air well into sunlit latitudes where photochemical ozone destruction may have occurred. The correlation of ozone depletion and dehydration indicates that water ice PSCs provided the dominant surface for chlorine activation. An analysis of the time when the observed air masses could have formed type II PSCs for the first time limits the time scale for the observed ozone destruction to about 4 days. (Auth. mod.)

Yiou, P., Jouzel, J., Johnsen, S., Rögnvaldsson, Ö.E., **Rapid oscillations in Vostok and GRIP ice cores,** *Geophysical research letters,* Aug. 15, 1995, 22(16), p.2179-2182, 32 refs.

This paper investigates the spectral properties of climatic time series derived from two recent ice cores in Greenland and East Antarctica. The signals behave in a similar way in the high frequency part of their spectra. The rapid oscillations found in the GRIP ice core were closely correlated to Heinrich Events. A comparable spectral feature is detected in the Vostok ice core. The possibilities of connections between the two hemispheres and proper ice sheet oscillations in the light of simple oscillating climate models are discussed. (Auth. mod.)

Murayama, S., et al, **Concentration variations of atmospheric CO_2 over Syowa Station, Antarctica and their interpretation,** *Tellus,* Sep. 1995, 47B(4), p.375-390, 42 refs.

Aircraft and ground-based measurements of the atmospheric CO_2 concentration have been made at Showa Station since Jan. 1983. The minimum concentration of the average seasonal CO_2 cycle occurs in March throughout the troposphere, while the maximum concentration appears in mid-August in the upper troposphere and in late September in the lower and middle troposphere. The peak-to-peak amplitude of the cycle decreases slightly with height. The CO_2 concentration increases with height during most of the year, but from late winter to spring this height dependency is minimal. To examine the contribution of the atmospheric transport processes to these variations in CO_2 concentration, a 3-dimensional trajectory analysis was performed using data from the U.S. National Meteorological Center. From the results obtained, it is postulated that northern hemispheric air with relatively high CO_2 concentration is transported to the antarctic region through the upper troposphere from late fall to winter, while air with low CO_2 concentration is transported from the Southern Hemisphere middle latitudes into the antarctic region through the lower troposphere in the remaining seasons. (Auth.)

Osada, K., **Recent progress in Vostok ice core analysis: paleoclimate and paleoenvironment,** *Seppyo,* Mar. 1995, 57(1), p.57-59, In Japanese. 15 refs.

Selected reports through 1994 on the Vostok ice core are briefly reviewed. Fifteen references are cited of which two are in Japanese and 13 are in English. The ice core records of Vostok and Greenland indicate that during the last glaciation, when there were warming periods of over 2000 years in Greenland, there were corresponding warming periods in Antarctica. It is suggested that comparative analyses of Vostok, Greenland, and ocean drilling cores may provide a model for the relationship between Antarctica and global climate change in the future.

Figge, R.A., White, J.W.C., **High-resolution Holocene and late glacial atmospheric CO_2 record: variability tied to changes in thermohaline circulation,** *Global biogeochemical cycles,* Sep. 1995, 9(3), p.391-403, 53 refs.

Results are presented from a new method for detecting changes in atmospheric CO_2 based on $\delta^{13}C$ analyses of selected peat components from a peat core in southern South America. The paleo-CO_2 record has decadal resolution spanning the last 14,000 radiocarbon years and compares well with antarctic ice core CO_2 data. Sharp peaks in CO_2 are detected during the late glacial, specifically at 10,200, 11,600 and 12,900 years BP. When compared to two deep-sea records interpreted to reflect changes in thermohaline circulation, these CO_2 pulses appear to relate to degassing events of the ocean associated with reinitiation of the thermohaline circulation occurring at this time. Two broad Holocene CO_2 excursions are also identified with peaks at 4,200 and 7,700 years BP. The driving mechanisms behind these excursions appear to be different from those in the late glacial. (Auth. mod.)

Peng, G.B., Li, Q., Qian, B.D., **Climate and ice-snow cover** [Qihou yu bingxue fugai], Beijing, Qixiang chubanshe (Meteorology Press), 1992, 349p., In Chinese with English table of contents. Numerous refs. passim.

DLC QC926.32.P46 1992 Orien China

A general discussion is presented of the effects of sea ice, ice sheets, and snow on climate and of climate on ice and snow covers, mainly global, but with particular examples pertinent to the Antarctic, Arctic, and China and the relationship between them. The book is divided into six chapters: the global distribution of ice and snow covers; the effect of ice and snow covers on atmospheric circulation; the effect of atmospheric circulation on ice and snow covers; numerical modeling of ice-atmosphere processes; general circulation models; and ice and snow covers in weather forecasting. There is an English table of contents and each chapter contains numerous references in English, Chinese, and Russian.

Austin, J., Hofmann, D.J., Butchart, N., Oltmans, S.J., **Mid stratospheric ozone minima in polar regions,** *Geophysical research letters,* Sep. 15, 1995, 22(18), p.2489-2492, 11 refs.

Recent springtime measurements of ozone vertical profiles in polar regions have revealed local ozone depressions of about 25% at altitudes near 30 km. Similar features are also identified in three-dimensional photochemical model results. The modeled ozone depressions are local and temporary, often associated with stratospheric warming events which transport air from low latitudes, altering its photochemical history. The feature may be a component of the climatology of the region, but occurs less frequently in the model, possibly because of the long-standing problem of the underprediction of upper stratospheric ozone. Both arctic and antarctic data are presented. (Auth. mod.)

Hofmann, D.J., Oltmans, S.J., Johnson, B.J., Lathrop, J.A., Harris, J.M., Vömel, H., **Recovery of ozone in the lower stratosphere at the South Pole during the spring of 1994,** *Geophysical research letters,* Sep. 15, 1995, 22(18), p.2493-2496, 15 refs.

During 1994, springtime antarctic ozone measured at the south pole did not reach the record lows recorded during the 1993 ozone hole period when a value of 91±5 DU was observed. A low of 102 DU was recorded on Oct. 5, 1994, but such values were not sustained as in 1993. The recovery of total ozone in 1994 was mainly the result of moderation of ozone destruction in the 10-14 km region, probably related to diminishing stratospheric aerosol from the Pinatubo eruption, and may have also been related to disturbance of the vortex earlier than normal. As in 1993, ozone profiles at the minimum showed nearly complete destruction of ozone between 15 and 20 km in 1994. In this region, the rate of decline of ozone in September was as fast or somewhat faster than in 1992 and 1993 indicating continuing saturation of the ozone destroying chemistry, which is expected as stratospheric chlorine amounts continue to rise. As in 1993, ozone was again observed to be reduced in the 22-24 km region, suggesting that the ozone hole has now probably extended to a region unaffected prior to 1992. (Auth. mod.)

Richwine, L.J., Clapp, M.L., Miller, R.E., Worsnop, D.R., **Complex refractive indices in the infrared of nitric acid trihydrate aerosols,** *Geophysical research letters,* Oct. 1, 1995, 22(19), p.2625-2628, 21 refs.

In experiments which simulate chemical reactions within polar stratospheric clouds, the refractive indices of nitric acid trihydrate (NAT) have been determined from the infrared spectra of laboratory generated aerosols. The aerosols are formed through homogeneous nucleation in a flow cell with separate regions for nucleation and observation, allowing for independent control of the temperature conditions in these regions. A spectrum of small, non-scattering particles is recorded to determine the frequency-dependent imaginary refractive index, within a scaling factor. A subtractive Kramers-Kronig routine is then used to calculate the real index. The scaling factor for the imaginary indices is determined by fitting a spectrum associated with larger, scattering particles, which depends on both the real and imaginary portions of the refractive indices. The complex refractive indices of NAT are reported over the range 700/cm to 4000/cm. (Auth. mod.)

Kane, R.P., **Effect of antarctic ozone holes of 1988, 1989, and 1990 on lower latitudes of the Southern Hemisphere,** *Annales geophysicae,* June 1995, 13(6), p.656-659, 10 refs.

The October depletions in the antarctic ozone spread to lower latitudes in early Nov. in 1988, in late Nov. in 1989, and in late Oct. in 1990. The depletions were 10-15% for latitudes up to 40°S and smaller thereafter, and almost negligible at 25°S and beyond. However, for the Southern Hemisphere, the normal seasonal changes at middle latitudes from Oct. to Dec. are much larger (about 20%). Also, there are superposed fluctuations of about 20% over a few (5-6) days. (Auth.)

Wang, Y.J., **Variation of atmospheric ozone and NO_2 at Zhongshan Station, antarctic spring,** *Antarctic research (Chinese edition),* June 1995, 7(2), p.45-50, In Chinese with English summary. 13 refs.

Using visible/UV differential absorption spectroscopy, the author observed atmospheric ozone and NO_2 contents at Zhongshan Station during the antarctic ozone hole in 1991. The results show that the ozone depletion occurs rapidly during the middle of Aug. and reaches a minimum value on Oct. 3, and after 4 days the ozone content quickly returns to normal values. The variations of atmospheric ozone and NO_2 content have a good positive correlation of up to 0.69. During the ozone hole, the content of NO_2 is always on a low level and the altitude of its layer is higher. It shows that the ozone depletion was not due to the catalytic loss process of odd nitrogen at Zhongshan Station. (Auth.)

Jonsson, S., **Synoptic forcing of wind and temperature in a large cirque 300 km from the coast of East Antarctica,** *Antarctic science,* Dec. 1995, 7(4), p.409-420, 35 refs.

Between Jan. 18, 1988 and June 3, 1989, an automatic weather station recorded 13 different weather parameters every 3 h on a blue-ice area located in central Heimefront Range, 300 km from the Weddell Sea coast. The first part of this paper reports on annual and monthly data regarding air temperature, air pressure, wind speed and wind direction, and a comparison is also made with corresponding data from Neumayer and Halley stations. The second part deals mainly with winter conditions in the region. They seem, at least during 1988-89, to have been characterized by a large-scale (30-40 days) and, superimposed on the large-scale, a small-scale (3-4 days) covariation of air temperature, air pressure and wind speed. The large-scale variation was earlier found to be synoptically forced. This paper shows that synoptic forcing exists also on smaller time scales. (Auth. mod.)

Yagüe, C., Redondo, J.M., **Case study of turbulent parameters during the antarctic winter,** *Antarctic science,* Dec. 1995, 7(4), p.421-433, 25 refs.

Two days of the antarctic winter (June 20-21, 1986) were chosen to study some turbulent parameters in this particular boundary-layer. Richardson number, Monin-Obukhov length, eddy transfer coefficients, turbulent kinetic energy, turbulent intensities, friction velocities and sensible heat flux at three levels (5, 17 and 32 m) were considered. The results show how the stability at 17 and 32 m influences the turbulent transfer at 5 m. Wind shear is the main mechanism to produce mixing in the lower atmosphere in Antarctica; thermal inversions associated with surface cooling develop with winds <10/s at 5 m. The possible influence of internal gravity waves on the atmospheric boundary-layer during strong stable stratification is studied. (Auth.)

Frederick, J.E., **Ultraviolet sunlight reaching the Earth's surface: a review of recent research,** *Photochemistry and photobiology,* 1993, 57(1), p.175-178, 29 refs.

DLC QD601.A1P48

This paper summarizes current knowledge of ultraviolet (UV) solar radiation reaching the earth's surface with emphasis on results obtained since the last yearly review. The implications of large UV-B irradiances for the antarctic ecosystem are discussed. Although substantial enhancements over the normal background radiation levels have occurred, the absolute irradiances have not exceeded those typical of an unperturbed summer at middle latitudes. Available data indicate a measurable inhibition of photosynthesis in antarctic phytoplankton during periods of large ozone depletion in 1990. It is concluded that much more work needs to be done before definitive statements can be made concerning biological and ecological effects of current UV-B radiation levels over Antarctica. (Auth. mod.)

Genthon, C., Braun, A., **ECMWF analyses and predictions of the surface climate of Greenland and Antarctica,** *Journal of climate,* Oct. 1995, 8(10), p.2324-2332, 18 refs.

A global reanalysis of recent climate is being carried out at the European Centre for Medium-Range Weather Forecasts (ECMWF). At the surface of the polar ice sheets (the atmospheric boundary condition for ice evolution), observations of climate are particularly scarce. To estimate how the new ECMWF climatology might help provide climate data over the polar ice sheets, the authors present 6 years of previously analyzed surface temperature and predicted precipitation for both Greenland and Antarctica. Analyses are the result of 6-h forecasts corrected to fit with reports from weather stations. In spite of a sparse coverage of the observation network, the analyzed temperature, including seasonality, is very reasonable. Interannual variability, however, appears greater than suggested by satellite observation. Mean annual precipitation in Antarctica is fairly well represented, but it is difficult to determine whether a lack of seasonality on the plateau is reasonable or not. Precipitation in coastal Greenland is often too high, and accumulation might be low inland. Mean predicted accumulations, 1594×10^{12} and 539×10^{12} kg/yr, over the Antarctic and Greenland ice sheets, respectively, are in good agreement with previous estimates. It is reasonable to expect that the reanalysis will largely satisfy the need for a full-coverage gridded climatology of the two polar ice sheets. (Auth. mod.)

Crewell, S., Cheng, D.J., De Zafra, R.L., Trimble, C., **Millimeter wave spectroscopic measurements over the South Pole. 1. A study of stratospheric dynamics using N_2O observations,** *Journal of geophysical research,* Oct. 20, 1995, 100(D10), p.20,839-20,844, 23 refs.

Millimeter wave measurements of N_2O and O_3 were made nearly continuously from Feb. 1993 through early Jan. 1994 at the Amundsen-Scott Station. In order to separate chemical and dynamical effects, this paper uses the observations of the long-lived tracer N_2O to study stratospheric dynamics. The main emphasis is on the synoptic evolution of the polar vortex over an entire winter period, and quantitative results are given for various times and altitudes. Diabatic descent rates derived for different altitude levels showed the strongest descent in austral fall at high altitudes, agreeing fairly well with other model predictions. Subsidence was observed to continue until late Oct., well after polar sunrise. The breakdown of the vortex occurred first in the upper stratosphere, marked by the intrusion of N_2O-rich air at these altitudes, consistent with trajectory calculations. Calculated descent rates are not consistent with the idea that the polar vortex is a "flowing processor", rather it should be viewed as an isolated system. (Auth. mod.)

Eluszkiewicz, J., Plum, R.A., Nakamura, N., **Dynamics of wintertime stratospheric transport in the Geophysical Fluid Dynamics Laboratory SKYHI general circulation model,** *Journal of geophysical research,* Oct. 20, 1995, 100(D10), p.20,883-20,900, 36 refs.

The kinematics of air motion in and around the polar vortices in the Geophysical Fluid Dynamics Laboratory SKYHI general circulation model are investigated by means of a Lagrangian particle analysis. Particles initialized in the mesosphere and upper stratosphere rapidly descend to the middle stratosphere. The dynamics of polar descent are investigated by diagnosing the forcing of the residual circulation. In the upper stratosphere, diabatic descent inside polar vortices is driven by Eliassen-Palm flux divergences associated with motions of period shorter than 2 days (presumably gravity waves) in the Antarctic, but of period greater than 3 days (presumably planetary waves) in the Arctic. In the lower stratosphere, long period processes, mainly from the 10 to 1 hPa region, produce descent near the vortex edge in both hemispheres. (Auth. mod.)

Iraci, L.T., Middlebrook, A.M., Tolbert, M.A., **Laboratory studies of the formation of polar stratospheric clouds: nitric acid condensation on thin sulfuric acid films,** *Journal of geophysical research,* Oct. 20, 1995, 100(D10), p.20,969-20,977, 38 refs.

In a laboratory simulation of polar stratospheric cloud formation, thin sulfuric acid films were exposed to HNO_3 and H_2O and cooled to temperatures near the ice frost point. Fourier transform infrared (FTIR) spectroscopy was used to probe the condensed-phase species during isothermal experiments, and gas pressures were monitored with mass spectrometry. Supercooled liquid sulfuric acid films exposed to HNO_3 showed indications of HNO_3 uptake to form ternary solutions, followed by crystallization of nitric acid trihydrate (NAT). These film studies suggest that crystalline polar stratospheric cloud (PSC) growth is most easily accomplished when stratospheric sulfate aerosols (SSAs) remain liquid, absorb HNO_3, and produce crystalline nitric acid trihydrate via heterogeneous nucleation. If SSAs crystallize to SAT at some point during the winter, nitric acid condensation is hindered, and PSC formation could become more difficult. (Auth. mod.)

Ricchiazzi, P., Gautier, C., Lubin, D., **Cloud scattering optical depth and local surface albedo in the Antarctic: simultaneous retrieval using ground-based radiometry,** *Journal of geophysical research,* Oct. 20, 1995, 100(D10), p.21,091-21,104, 36 refs.

Solar irradiance measurements from a ground-based multichannel radiometer system deployed at Palmer Station during spring 1991 are used to simultaneously estimate cloud scattering optical depth and surface albedo. Irradiance measurements at 410 and 630 nm, in conjunction with a discrete ordinate radiative transfer (RT) model, enable this simultaneous retrieval by exploiting the wavelength dependence in Rayleigh scattering strength. The RT model is used in an inverse mode to find the values of surface albedo and cloud optical depth that match calculated and measured irradiances at both wavelengths. Under the homogeneous stratiform cloud cover for which the technique applies, surface albedo at 630 nm was consistently retrieved at above 0.9. For most homogeneous overcast conditions, cloud optical depth (at 630 nm) is found to be in the range of 20-50, with a most probable value of 25. (Auth. mod.)

Hanson, D.R., **Reactivity of $ClONO_2$ on $H_2{}^{18}O$ ice and organic liquids,** *Journal of physical chemistry,* Aug. 31, 1995, 99(35), p.13,059-13,061, 21 refs.

In experimental simulation of polar stratospheric cloud dynamics, the reactive uptake of $ClONO_2$ onto ^{18}O-labeled ice and onto organic liquids was measured in a cylindrical flow tube reactor using chemical ionization detection. The hydrolysis of $ClONO_2$ on $H_2{}^{18}O$ ice produced primarily $H^{18}OCl$, indicating that the $Cl-ONO_2$ bond is broken upon hydrolysis on ice. The loss of $ClONO_2$ onto liquid organic surfaces (ethylene glycol, cyclohexanone, decanol, and tridecane) was found to be efficient (reaction probability >0.06), and the product HNO_3 was detected in the gas phase. This suggests that dissociation or ionization are not prerequisites for heterogeneous reactions of $ClONO_2$. (Auth. mod.)

Stamnes, K.H., Slusser, J., Bowen, M., **Derivation of total ozone abundance and cloud effects from spectral irradiance measurements,** *Applied optics,* Oct. 20, 1991, 30(30), p.4418-4426, 25 refs.

The authors describe a method to infer total ozone abundance and effective cloud transmission from global (diffuse plus direct) spectral irradiance measurements taken at the Earth's surface. The derivation of total ozone abundance relies on the comparison of measured irradiance ratios at two wavelengths in the UV part of the spectrum with a synthetic chart of this ratio computed for a variety of ozone abundances. The method presented here was applied for determining ozone abundance and cloud attenuation from the global irradiance measurements taken at McMurdo Station during the 1988-89 season. (Auth. mod.)

Dirección Meteorológica de Chile. Centro Meteorológico Antártico. Programa de Estudios e Investigación, **Workshop "Meteorological activities in King George Island", 5-6 Jan. 1995,** Santiago de Chile, 1995, 16p. + 2 appends.

To improve international cooperation among countries with meteorological stations on King George I., the Chilean Antarctic Meteorological Center "Presidente Eduardo Freí Montalva" organized the first in-situ workshop attended by representatives from Brazil, Chile, China, Korea, Poland, Uruguay and Russia. This document presents summaries of the participants' brief reports on their individual meteorological activities on the island, the principal agreements among nations toward developing and implementing a meteorological data base on King George I. with free access to all users, and the relevant recommendations.

Guretskiĭ, V.V., Danilov, A.I., Shtammer, D., **Movements of Antarctic Circumpolar Current eddies at the eastern boundary of the Weddell Gyre according to satellite altimetry data** [Dvizhenie vikhrevykh obrazovaniĭ antarkticheskogo tsirkumpoliarnogo techeniia na vostochnoĭ granitse krugovorota Ueddella po dannym sputnikovoĭ al'timetrii], *Akademiia nauk. Doklady,* May-June 1992, 324(1), p.191-195, In Russian. 10 refs.

The obtained data allow a more thorough understanding and assessment of the effect of the active eddy formation zone in the Antarctic Circumpolar Current on the distribution of drifting ice south of the area. One can propose an analogous eddy regime in similar regions of the circumpolar current (Kerguelen Plateau, south of New Zealand, and in the Pacific Ocean sector east of the Udintsev fracture zone). (Auth mod.)

Kavun, M.M., Vinnikovskaia, O.S., **New geophysical data on little known parts of the South Orkney trough and the Central Scotia basin** [Novye geofizicheskie dannye po maloizuchennym chastiam IUzhno-Orkneĭskogo troga i tsentral'nogo basseĭna moria Skosha], *Akademiia nauk. Doklady,* Oct. 1992, 326(5), p.860-864, In Russian. 8 refs.

Brief results from geophysical studies carried out in 1990 by the research vessel *Geolog Dmitriĭ Nalivkin* are presented. The material shows that the prevailing discussion on the origin of the South Orkney trough as a transformed fault probably needs correction. There is still insufficient data to identify the subduction zone of the earth's crust. Ocean depths within the boundaries of the trough are less than the average values for the deep bottom trough, and manifestations of volcanism in the South Orkney islands have not been revealed. (Auth. mod.)

Fahrbach, E., Augstein, E., Olbers, D., **Impact of shelf and sea ice on water mass modifications and large-scale oceanic circulation in the Weddell Sea,** Antarctic science: global concerns. Edited by G. Hempel, Berlin, Springer Verlag, 1994, p.167-187, 54 refs.

DLC G845.5.A54 1994

Following a review of the water masses and circulation in the global ocean, the focus shifts to some of the unique physical conditions of Weddell Sea waters. This portion of the review includes accounts of what is known of the Weddell Sea water mass modifications and the mechanics of the Weddell Gyre. Comparisons between observations and numerical models of these waters are discussed. There are also displayed contrasting illustrations showing stream function of the total mass transport in the South Atlantic Ocean and the southern Indian Ocean. Additional figures show the mean annual freezing and melting rates with a coupled ice-ocean-atmosphere model in the Weddell Sea. A final figure shows a two-dimensional model of the circulation under the Filchner-Ronne Ice Shelves.

Ishida, A., **Effects of partial meridional barriers on the Antarctic Circumpolar Current—Wind-driven barotropic model,** *Dynamics of atmospheres and oceans,* May 1994, 20(4), p.315-341, 24 refs.

The structure and transport of the Antarctic Circumpolar Current are examined by means of a simple barotropic model. The effects of two partial meridional barriers corresponding to the South American peninsula and the island arc to the east are investigated. The transport is given by the ratio of the pressure difference produced by wind stress to the resistance resulting from bottom friction. In the limiting case with no friction, the pressure difference is determined by the magnitude of the wind stress at the latitudes of the ends of the two meridional barriers; the resistance is proportional to the difference between the Coriolis parameters at the same sites. The transport predicted by the model is reasonable when compared with the observed value. This suggests that the mechanism discussed can be applied to the real ocean. A relationship between the transport and the topographic drag on the meridional barriers is found. The time change of the transport is determined by the drag on the meridional barriers, the bottom stress, and the rate at which momentum is supplied by wind stress. The transport lags wind stress by several days. (Auth.)

Liang, X.S., Dong, Z.Q., Su, J.L., **Condition for the formation of Antarctic Bottom Water in Prydz Bay, Antarctica,** *Antarctic research,* June 1994, 5(1), p.62-74, 15 refs.

Through pseudoinverse inference of the circulation in Prydz Bay and its adjacent open ocean during Jan.-Mar. 1981, and comparing the results with 1991, the authors found that when the east wind drift is strong and extends its influence north of the slope, it is difficult for the Circumpolar Deep Water (CDW) to upwell onto the shelf, and consequently the Antarctic Bottom Water (AABW) cannot form in the bay by way of the mixing scheme of Foster and Carmack (1976). However, when the east wind drift weakens and confines itself to the shelf, the westerly current will press on the slope and revolve anticyclonically while it is fairly strong. Such an anticyclonal pattern manifests itself mainly in the lower layer and, as a result, it will make the CDW upwell onto the shelf, providing an essential prerequisite for the formation of the AABW. The authors have analyzed this phenomenon from a dynamical viewpoint, and note that the law of heat conduction accounts for its formation, in which the planetary and topographical beta effects play major roles. (Auth. mod.)

Takahashi, T., Goddard, J.G., Rubin, S.I., Breger, D., **Seasonal study of carbon dioxide in the southern extreme of the Pacific sector, antarctic ocean,** *U.S. Department of Energy. Progress report,* May 5, 1994, DOE/ER/61758-1, 12p., DE94 014600, 3 refs.

The major aim of this investigation was to measure the distribution of the total CO_2 concentration and pCO_2 in seawater in the Pacific sector of the extreme southern ocean as far south as 78S. The areas investigated include the continental shelf areas in the Ross, Amundsen and Bellingshausen seas and the offshore deep water areas as far north as 67S. The measurements were made aboard the R/VIB *Nathaniel B. Palmer* between Feb. 14 and Apr. 5, 1994; the preliminary results are briefly described in this report. This constitutes the first of a pair of expeditions, the first being designed to investigate oceanic CO_2 sink/source conditions during the austral summer, while the second expedition, which is designed for the following winter, has been scheduled for Sep. 1994.

Treguier, A.M., Panetta, R.L., **Multiple zonal jets in a quasigeostrophic model of the Antarctic Circumpolar Current,** *Journal of physical oceanography,* Nov. 1994, 24(11), p.2263-2277, 28 refs.

The presence of multiple zonal fronts in the Antarctic Circumpolar Current (ACC), a phenomenon described as zonation, has been confirmed by many observations, suggesting that the fronts are circumpolar in extent. In the context of quasigeostrophic turbulence models, Panetta has shown that fronts associated with long-lived zonal jets develop spontaneously in very wide baroclinically unstable regions (of width large compared with the Rossby radius of deformation). The present paper examines the relevance of this mechanism to the zonation of the ACC, using a quasigeostrophic wind-forced channel model. Multiple jets appear when the forcing scale is wide enough, and they have horizontal scales and a strength that compares well with observations. However, in the presence of large-scale random topography, a different dynamical regime emerges in which the flow structure depends on the topographically controlled stationary eddies. (Auth.)

J-51796

Foster, T.D., **Antarctic Bottom Water formation in the northwestern Weddell Sea,** *Antarctic journal of the United States,* 1993, 28(5), p.75-76.

As part of a project to study the formation of Antarctic Bottom Water in the Weddell Sea, an oceanographic expedition was carried out in the northwestern sector of the Weddell Sea. A preliminary analysis of the potential temperature data from a long hydrographic section is shown in a figure. The structure of the potential temperature field is similar to that which was obtained for this same section in 1987 and 1991, with the exception of the surface layers where there are some differences due to seasonal effects. More significantly, the region of newly formed bottom water, indicated by potential temperatures below about -0.8 C, closely resembled those of 1987 and 1991. This may be evidence that the bottom water forms all year long in the western Weddell Sea.

J-51797

Weppernig, R., Schlosser, P., **Helium isotope results from Ice Station Weddell 1,** *Antarctic journal of the United States,* 1993, 28(5), p.76-77, 6 refs.

As part of the Ice Station Weddell 1 hydrography/tracer program, the authors collected about 400 helium isotope samples. Most of the samples were taken along the drift track of the ice floe. The first helium isotope data show very low isotopic helium-3 values in a thin bottom layer (about 100 m thick) along the drift track of the ice station. The ^{4}He concentrations of the surface waters reflect the ice cover during the time of sampling. Gas exchange is reduced because of the ice cover, and ^{4}He accumulates as Circumpolar Deep Water (CDW) entrains into the surface layer. At station 9, the gradient between surface water and CDW is well pronounced, which is an indication of a well-mixed surface layer and rapid gas exchange with the atmosphere. The ^{4}He concentrations increase slightly with depth, and one generally observes a maximum at about 100 m above the bottom. The authors interpret this pattern as an indication that there are different types of shelf water contributing to the deep and bottom waters formed in the western Weddell Sea.

J-51798

Hellmer, H.H., Gordon, A.L., Albarracin, J.I., Huber, B.A., **Western Weddell Sea hydrography,** *Antarctic journal of the United States,* 1993, 28(5), p.78-79, 5 refs.

The U.S.-Russian Ice Station Weddell 1 (ISW-1) provided the first comprehensive data set for the perennially ice-covered western Weddell Sea. As a region of potentially significant formation of cold bottom water, the western Weddell is of key importance in understanding the southern oceans' role in global heat fluxes and ventilation of the world's deep ocean. The temperature and salinity maxima over the continental slope characterize the core of the Weddell Sea's coastal current, which, as the southern limb of the cyclonic circulation, provides to the Continental Shelf the salt required for bottom-water production and the heat lost by air-ice-sea interaction.

J-51800

Rogers, J.C., Dunbar, R.B., **Carbon isotopic composition of particulate organic carbon in Ross Sea surface waters during austral summer,** *Antarctic journal of the United States,* 1993, 28(5), p.81-83, 10 refs.

The areal distribution of particulate organic carbon (POC) standing stock and POC δ^{13}C in ice-free areas of the Ross Sea during the 1991-1992 austral summer is reported. High surface-water POC levels were observed in the western Ross Sea along the Victoria Land coast. POC levels were low, between 172 and 180E, and increased again to the east of the 180 deg. The highest POC δ^{13}C values to the northeast of Ross I. are associated with low POC levels. The authors also observed significant ^{13}C depletion in areas of moderate POC concentration and ^{13}C enrichment in areas with low POC (east of site C). Transit samples collected from *Polar Sea* between Feb. 6-9, 1992 along the southern sampling transect show a significant positive correlation between δ^{13}C and POC.

J-51815

Matthies, D., Troll, G., **Distribution of fluorine in recent marine sediments related to petrographic composition: Bransfield Strait and northwestern Weddell Sea, Antarctica,** *Marine geology,* 1990, 91(4), p.313-324, 46 refs.

The fluorine budget of 40 marine surface sediment samples from the Atlantic sector of the antarctic seas has been examined in order to elucidate the relationship between granulometry, mineralogy, major and minor element chemistry, and the fluorine distribution. The concentrations of total fluorine range from 243 to 800 ppm. The clay and fine-silt fractions contribute 60-87% to the total concentration of fluorine. The clay fraction consists of clay minerals, detrital quartz, feldspars and an amorphous component (biogenic opal and volcanic glass shards). Fluorine concentrations in the crystalline components of Bransfield Strait and Weddell Sea sediments are 551-557 and 724-825 ppm, respectively. These variations are almost exclusively due to varying proportions of illite, which is greatly enriched in fluorine. Montmorillonite and mixed-layer clays, which carry approximately as much fluorine as illite, are present only in insignificant amounts in these sediments. Biogenic opal (essentially diatom skeletons), which accounts for 3-77 wt.% of the clay fraction, contains 15 ppm fluorine. Thus, fluorine abundance in the clay fraction is negatively correlated with the content of biogenic opal. Volcanic glass shards contain 1688-3758 ppm fluorine. They comprise only up to 3 wt.% of the clay fraction and are of minor relevance in the total fluorine budget in these sediments. (Auth. mod.)

Ackley, S.F., Sullivan, C.W., **Physical controls on the development and characteristics of antarctic sea ice biological communities—a review and synthesis,** *Deep-sea research pt.I,* 1994, 41(10), p.1583-1604, Refs. p.1600-1604.

Ice structures found in antarctic sea ice and related morphological processes are summarized, including frazil ice growth; the flooded snow layer; pressure ridge induced flooding; thermally driven brine drainage; and platelet-ice formation. The associated colonization, physiological adaptation, and growth of sea ice biota within these structures, to the levels presently identifiable, are also reviewed. Variability of ice structure and associated biological communities over small spatial scales necessitated analysis of the biological component in combination with physical and chemical properties of the sea ice. The ice microstructure provides indications of the growth and evolution of ice properties and initially defines how ice biota colonize the ice. While the ice microstructure shapes the localized biological response, relatively large regions of pack ice have characteristic microstructures. Regional patterns of biomass and biological productivity within the antarctic sea ice zone may therefore be predictable as a result of these physical-biological associations. Examples from the drifting pack ice and fast ice zones of the Weddell and Ross Seas are given. (Auth. mod.)

Gammelsrød, T., et al, **Distribution of water masses on the continental shelf in the southern Weddell Sea,** *American Geophysical Union. Geophysical monograph series,* 1994, No.85, Polar oceans and their role in shaping the global environment. Edited by O.M. Johannessen, R.D. Muench, and J.E. Overland, p.159-176, 35 refs.

Water properties on the continental shelf in the southern Weddell Sea observed during NARP 92-93 are presented. The station distribution includes a section close to the floating ice shelf from the Filchner Depression to the Antarctic Peninsula. Temperature, salinity, oxygen, silicate, CFC-11 and CFC-12 distributions are shown. Melting under the ice shelves, circulation systems, residence times, sediment/water interactions and bottom water formation are discussed. Ice Shelf Water (ISW), which is formed by cooling and melting below the floating ice shelf, seems to be about 10 years older than its parent water mass, which indicates the residence time below the ice shelf. The average melting rate below the Filchner Ronne ice shelf, based on the volume flux of ISW in the Filchner Depression, is estimated to be 0.1 m/year. Compared with earlier observations, considerable changes were found in the water characteristics and distribution; the temperature of the Weddell Deep Water has increased 0.7 C since 1977. Western Shelf Water, usually dominating the bottom layers in the Filchner Depression and on the Berkner Shelf, was found only in the Ronne Depression. (Auth.)

Rutgers van der Loeff, M.M., **^{228}Ra and ^{228}Th in the Weddell Sea,** *American Geophysical Union. Geophysical monograph series,* 1994, No.85, Polar oceans and their role in shaping the global environment. Edited by O.M. Johannessen, R.D. Muench, and J.E. Overland, p.177-186, 35 refs.

^{228}Ra and its granddaughter ^{228}Th were measured on a N-S transect from 45S to the Antarctic continent across the Antarctic Circumpolar Current (ACC) and the Weddell Sea. The distributions of ^{230}Th, ^{228}Th and ^{228}Ra show that southward transport across the ACC of Circumpolar Deep Water (CDW), the source of Warm Deep Water (WDW) in the Weddell Sea, occurs on a time scale between 8 and 30 years, in qualitative agreement with estimates of the upwelling rate of WDW. The distribution of ^{228}Ra in deep waters is controlled by advection and isopycnal mixing rather than diapycnal mixing. In the Weddell Sea, deep-water ^{228}Ra activities reach 15-20 dpm/m^3. Enrichment in deep water is controlled by the production in the deep-sea floor, favored by low biogenic sediment accumulation rates and consequently high ^{232}Th contents in the surface sediment (3 to 5 dpm/g). The highest ^{228}Ra value (73 dpm/m^3) was observed near the sea floor in a channel where an eastern outflow of Weddell Sea Bottom Water (WSBW) is suspected. It is not yet known whether this value is produced *in-situ* by accumulation in the stratified bottom water, or contains a signal of enrichment in shelf- and Ice Shelf Water.

Poisson, A., et al, **Air-sea CO_2 fluxes in the Southern Ocean between 25E and 85E,** *American Geophysical Union. Geophysical monograph series,* 1994, No.85, Polar oceans and their role in shaping the global environment. Edited by O.M. Johannessen, R.D. Muench, and J.E. Overland, p.273-284, 22 refs.

The variations of ΔfCO_2 (difference of sea surface and atmospheric carbon dioxide fugacities) and air-sea CO_2 fluxes are described in the western Indian sector of the southern ocean. Measurements were made during two cruises in Jan.-Apr. 1991 and one cruise in Feb. 1993. ΔfCO_2 distributions observed in Feb. 1987 and Feb. 1993 at 30E are also compared. Large ΔfCO_2 variations have been observed, most of which can be related to dynamical variability and/or local biological activity, near the ice edge, the Antarctic Divergence, the Polar Front Zone or local change in topography (e.g. Kerguelen Plateau). Near the pack ice, clear relationships are found between low ΔfCO_2 (CO_2 sink area) and high chlorophyll-a concentrations. A significant CO_2 source region was found in Feb. 1993 centered on the antarctic divergence. South of the Polar Front Zone, fCO_2 decreases strongly; this signal was also found in 1987 and 1991 and can be related to high chlorophyll signal. In the region of the Kerguelen Plateau, ΔfCO_2 spatial variability is very high. Comparing years 1987 and 1993 reveals that when considering interannual variability (mainly related to SST differences between the two periods) the change in ΔfCO_2 has been low over 6 years. Launiainen, J., Vihma, T., **On the surface heat fluxes in the Weddell Sea,** *American Geophysical Union. Geophysical monograph series,* 1994, No.85, Polar oceans and their role in shaping the global environment. Edited by O.M. Johannessen, R.D. Muench, and J.E. Overland, p.399-419, 60 refs.

Turbulent surface fluxes of sensible and latent heat in the Weddell Sea were studied using drifting marine meteorological buoys with satellite telemetry. In 1990-1992 a total of 5 buoys were deployed on the sea ice, in the open ocean, and on the edge of a floating continental ice shelf. Buoy measurements included wind speed, air temperature and humidity with duplicate sensors, and yielded year-round time series. Modification of the continental air-mass flowing out from the shelf ice to the open sea was studied with aerological soundings made from a research vessel. Associated turbulent heat exchange was estimated on the basis of three methods: modification in the temperature profiles, surface observations, and diabatic resistance laws for the atmospheric boundary layer. If one estimates an area-averaged turbulent heat exchange between the surface and the atmosphere for the whole Weddell Sea on the basis of these data, the large upward fluxes from leads and coastal polynyas (with an areal coverage of 5 to 7% in wintertime) approximately balance the downward fluxes over the sea ice. A first-order estimate for the annual area-averaged total vertical heat loss from the water mass is 20 to 30 W/m^2. (Auth. mod.)

Campbell, W.J., Josberger, E.G., Mognard, N.M., **Southern Ocean wave fields during the austral winters 1985-1988, by Geosat radar altimeter,** *American Geophysical Union. Geophysical monograph series,* 1994, No.85, Polar oceans and their role in shaping the global environment. Edited by O.M. Johannessen, R.D. Muench, and J.E. Overland, p.421-434, 16 refs.

The Geosat radar altimeter is the first satellite sensor to have acquired a global sea state data set over a period of several years. The Geosat altimeter observations over the southern ocean have been processed to derive the austral winter seasonally averaged wave fields from 1985 through 1988. With the satellite observations, the highest sea states for each of the four austral winters are found south of latitude 40S and can reach the antarctic ice edge. In general, the highest Geosat mean significant wave heights are of the order of 4 to 5 m, and within each ocean there is a significant annual variation in the extent of these regions with large wave heights. In the region south of 50S, 30 to 50% of the measured wave heights are greater than 5 m. The Indian Ocean south of 40S is almost entirely covered with these large waves while the Atlantic Ocean is significantly calmer, with only the eastern portion containing such large waves, which do not occur every year. (Auth. mod.)

J-51962

Thomas, J.P., Turner, J., Symon, C.J., **Comparison of ATSR and shipboard radiometer SST measurements along transects between the U.K. and the Antarctic,** Space at the service of our environment: proceedings of the first ERS symposium, Nov. 1992, Cannes, France. Edited by B. Kaldeich, Noordwijk, Netherlands, ESA Publications Division, 1993, p.801-805, 3 refs.

Between Oct 1991 and May 1992 a campaign to make *in-situ* SST measurements to validate the ATSR SST product was carried out from the RRS *Bransfield* as it sailed from the UK to Antarctica and back. The ship carried an infrared radiometer, a temperature sensor trailed from the side and a hull thermistor. The results show that the present ATSR SST product gives results cooler than the *in-situ* measurements. In the tropics the difference was 1K except in the one case where the forward view was used in the retrieval, when agreement was within 0.1 K.

Goosse, H., Hecq, J.H., **Modelling the ice-ocean-plankton**

interactions in the southern ocean, *Journal of marine systems,* Dec. 1994, 5(6), p.471-484, 63 refs.

Using the Ross Sea as a model, this paper examines interactions between sea ice and ocean and their influence on planktonic communities using a physical model which includes explicity melting dynamics and mixed-layer physics. A one-dimensional model of the water column with a k-1 turbulent closure is applied. The sea-ice model is the one proposed by Semtner (1976); added is a parameterization of leads. This study emphasizes the importance in this kind of model of the sharing of the energy between lateral and basal meltings. The biological model comprises two state variables: phytoplankton and zooplankton biomasses. Melting induces a persistent shallow mixed layer and thus appropriate conditions for primary production. If ice melting is present, high biomasses are possible even with high losses. The absence of ice nearly forbids a massive bloom to form. Some sensitivity studies have shown that grazing pressure is a key factor governing the evolution of biomasses. The biomasses are also sensitive to small modifications of photosynthetic production. The initial amount of phytoplankton and the presence of ice algae seem to be of lesser importance. (Auth. mod.)

Domack, E.W., Foss, D.J.P., Syvitski, J.P.M., McClennen, C.E., **Transport of suspended particulate matter in an antarctic fjord,** *Marine geology,* Nov. 1994, 121(3-4), p.161-170, 19 refs.

Vertical profiles of temperature, salinity, and light attenuation were used in conjunction with underwater photography and water samples to characterize the nature and dynamics of particle transport in an antarctic fjord. Most of the particles are sand-sized (0.1-2 mm) floccules comprised of individual grains in the 5 to 50 micron size range. The quartz silt grains are derived from basal debris-laden meltwater originating from beneath the submerged valley glacier. The meltwater buoyantly rises to form cold water interflows at mid-water depths. Turbulent mixing near the seafloor also plays a role in the transport and breakup of floccules. Together the midwater cold tongues and near-bottom turbidity account for 87% of the total sediment load, thus attesting to the importance of non-surface transport mechanisms in polar fjords. (Auth. mod.)

Howington, J.P., McFeters, G.A., Jones, W.L., Smith, J.J., **Effect of low temperature on BOD in antarctic seawater,** *Water research,* Dec. 1994, 28(12), p.2585-2587, 11 refs.

Untreated sewage has been released from McMurdo Station into McMurdo Sound for several years. In this study organic carbon degradation was compared in seawater from McMurdo Sound at -1.8°C and 20°C using the biochemical oxygen demand (BOD) test. The ultimate BOD was 3 times larger at 20°C than at -1.8°C following 25 days of incubation. On the basis of on these findings, sewage from McMurdo Station should receive at least secondary treatment before release to lessen the impact of anthropogenic organic carbon on the polar marine environment of McMurdo Sound. (Auth. mod.)

England, M.H., Garçon, V.C., **South Atlantic circulation in a world ocean model,** *Annales geophysicae,* Oct. 1994, 12(9), p.812-825, 57 refs.

Preliminary analysis of the modelled ocean circulation in the region indicates a rather close agreement of the simulated upper ocean flows with conventional notions of the large-scale geostrophic currents in the region. The modelled South Atlantic Ocean witnesses the return flow and export of North Atlantic Deep Water (NADW) at its northern boundary, the inflow of a barotropic Antarctic Circumpolar Current (ACC) through the Drake Passage, and the inflow of warm saline Agulhas water around the Cape of Good Hope. Topographic steering of the ACC dominates the structure of flow in the circumpolar ocean. The Benguela Current is fed by a mixture of saline Indian Ocean water and fresher subantarctic surface water. This analysis shows how the return path of NADW is partitioned between a cold water route through the Drake Passage (6.5 Sv), a warm water route involving the Agulhas Current shedding thermocline water westward (2.5 Sv), and a recirculation of intermediate water originating in the Indian Ocean. (1.6 Sv). (Auth. mod.)

Stevens, D.P., Thompson, S.R., **South Atlantic in the fine-resolution antarctic model,** *Annales geophysicae,* Oct. 1994, 12(9), p.826-839, 38 refs.

The geographical area covered by the Fine-Resolution Antarctic Model (FRAM) includes that part of the South Atlantic south of 24°S. A description of the dynamics and thermodynamics of this region of the model is presented. Both the mean and eddy fields in the model are in good agreement with reality, although the magnitude of the transients is somewhat reduced. The heat flux is northward and in broad agreement with many other estimates. Agulhas eddies are formed by the model and propagate westward into the Atlantic providing a mechanism for fluxing heat from the Indian Ocean. The confluence of the Brazil and Falkland currents produces a strong front and a large amount of mesoscale activity. In the less stratified regions to the south, topographic steering of the antarctic circumpolar current is important. (Auth.)

Fahrbach, E., Rohardt, G., Schröder, M., Strass, V., **Transport and structure of the Weddell Gyre,** *Annales geophysicae,* Oct. 1994, 12(9), p.840-855, 33 refs.

Determination of the structure of the Weddell Gyre and of the associated transports was one of the objectives of the Weddell Gyre Study which began in Sep. 1989 and ended in Jan. 1993. The collected data set comprises records of moored current meters and profiles of temperature and salinity distributed along a transect between the northern tip of the Antarctic Peninsula and Kapp Norvegia. The circulation pattern on the transect is dominated by stable boundary currents of several hundred kilometers width at the eastern and western sides of the basin. They are of comparable size on both sides and provide nearly 90% of the volume transport of the gyre which amounts to 29.5 Sv. In the interior, a weak anticyclonic cell of 800 km diameter transports less than 4 Sv. Apart from the continental slopes, the near-bottom currents flow at some locations in an opposite direction to those in the water column above, indicating a significant baroclinic component of the current field. The heat transport into the southern Weddell Sea is estimated to be 3.48×10^{13} W. (Auth. mod.)

Genco, M.L., Lyard, F., Le Provost, C., **Oceanic tides in the South Atlantic Ocean,** *Annales geophysicae,* Oct. 1994, 12(9), p.868-886, 27 refs.

The finite element ocean tide model of Le Provost and Vincent (1986) has been applied to the simulation of the M_2 and K_1 components over the South Atlantic Ocean. The discretisation of the domain, of the order of 200 km over the deep ocean, is refined down to 15 km along the coasts; such refinement enables wave propagation and damping over the continental shelves to be correctly solved. Zooms of the M_2 solution are presented for the Falkland Archipelago, the Weddell Sea and the Patagonian Shelf. The first zoom allows detailing of the tidal structure around the Falklands and its interpretation in terms of a stationary trapped Kelvin wave system. The second zoom, over the Weddell Sea, reveals for the first time what must be the tidal signal under the permanent ice shelf and gives a solution over the sea which is generally in agreement with observations. The third zoom over the complex Patagonian Shelf illustrates the ability of the model to simulate the tides, even over this area, with a surprising level of realism, following purely hydrodynamic modelling procedures, within a global ocean tide model. Maps of maximum associated tidal currents are also given, as a first illustration of a by-product of these simulations. (Auth. mod.)

López, O., García, M.A., S.-Arcilla, A., **Tidal and residual currents in the Bransfield Strait, Antarctica,** *Annales geophysicae,* Oct. 1994, 12(9), p.887-902, 11 refs.

During the 1992-93 oceanographic cruise of the Spanish R/V *Hespérides,* recording equipment was deployed in the Bransfield Strait. Six Aanderaa RCM7 current meters and three Aanderaa WLR7 tide gauges were successfully recovered after an operation period of 2.5 months. Relevant features of the time series obtained are presented and discussed in this paper. The emphasis is placed on the tidal character of the currents and the relative importance of tidal flow in the general hydrodynamics of the strait. For these purposes a dense grid of hydrographic stations, completed during the BIOANTAR 93 cruise, is used. Preliminary geostrophic calculations relative to a 400 m depth yield current velocities of around 0.20 m/s in the study area, whereas the magnitude of tidal currents is seen to be 0.30-0.40 m/s. (Auth.)

Popov, I.K., **Surface layer temperature of the southern ocean in iceberg penetration zones,** *Russian Academy of Sciences. Transactions. Earth science sections,* Nov. 1994, 328(1), p.220-223, 2 refs. For Russian original see 47-3337 or 21J-48305.

This paper presents an evaluation of the thermal state of the ocean surface in the iceberg-penetration zones, the initial information for which is the surface temperature distribution. The surface water temperature around individual drifting icebergs in the southern ocean south of the 60th parallel was observed under various hydrological conditions, with the temperatures of the upper quasihomogeneous level ranging from -1.5 to +2.5°C. During these temperature surveys, the ships circled the iceberg at various distances in the direction of a MGI 4202 temperature sensor. In some cases, remote IR-radiometry was used. In addition, the same towed temperature sensor was used to measure the horizontal distribution of surface-layer temperatures in a zone about 30 km long, located in the southernmost part of the iceberg path to the western Atlantic, at a time when the number of icebergs increased from 13 to 50 (as estimated from the field of view on the 15 mile scale of the ship's radar). Proceedings. Quantitative approaches in paleoceanography. Edited by R. Zahn et al and NATO Advanced Science Institutes, Series I. Global environmental change. Vol.17, Berlin, Springer Verlag, 1994, p.105-144, 59 refs.

DLC GC190.2.C37 1994

This paper presents recent benthic foraminiferal faunal distributions and benthic foraminiferal $\delta^{13}C$ from various sites in the southern ocean. The data are used as an analogue for interglacial conditions and compared to down-core changes in three South Atlantic Ocean and Weddell Sea cores. The data are used to reconstruct glacial-interglacial contrasts in paleoproductivity and deep and bottom water circulation. New benthic foraminiferal and stable isotope data from two cores spanning the last 400 kyr are presented. (Auth. mod.)

Zahn, R., Keir, R., **Tracer-nutrient correlations in the upper ocean: observational and box model constraints on the use of benthic foraminiferal $\delta^{13}C$ and Cd/Ca as paleo-proxies for the intermediate depth ocean,** NATO Advanced Research Workshop on Carbon Cycling in the Glacial Ocean: Constraints on the Ocean's Role in Global Change, Fellhorst, Germany, Sep. 17-19, 1992. Proceedings. Quantitative approaches in paleoceanography. Edited by R. Zahn et al and NATO Advanced Science Institutes, Series I. Global environmental change. Vol.17, Berlin, Springer Verlag, 1994, p.195-221, 34 refs.

DLC GC190.2.C37 1994

This paper employs the GEOSECS Shorebased Dataset (Östlund et al., 1987) to map the CO_2/phosphate distribution at high latitudes in order to examine the extent to which high-latitude processes determine the global tracer-nutrient pattern. The ocean-atmosphere $\delta^{13}C$-simulating box model of Keir (1988) is used to separate the effects of temperature and biofractionation on the disparate $\delta^{13}C$-PO_4 pattern at high latitudes. Subsequently, the results of an ocean box model which was designed to coarsely simulate the distribution of phosphate as well as other tracers is presented. The model results generally support the hypothesis of productivity-driven variations in the cadmium-nutrient relation, and further suggest that cadmium tends to be recycled slightly shallower in the water column than is phosphate. (Auth. mod.)

Shimmield, G.B., Derrick, S., Mackensen, A., Grobe, H., Pudsey, C., **History of barium, biogenic silica and organic carbon accumulation in the Weddell Sea and Antarctic Ocean over the last 150,000 years,** NATO Advanced Research Workshop on Carbon Cycling in the Glacial Ocean: Constraints on the Ocean's Role in Global Change, Fellhorst, Germany, Sep. 17-19, 1992. Proceedings. Quantitative approaches in paleoceanography. Edited by R. Zahn et al and NATO Advanced Science Institutes, Series I. Global environmental change. Vol.17, Berlin, Springer Verlag, 1994, p.555-574, 51 refs.

DLC GC190.2.C37 1994

This paper presents geochemical data (biogenic silica, organic carbon, barium) to address changes in palaeoproductivity at 68°S in the eastern Weddell Sea. $\delta^{18}O$ measurements on planktonic and epibenthic foraminifera are used to provide a reliable age model. A transect of four cores across the Weddell Sea to the Scotia Sea is examined using the same proxy palaeoproductivity indicators. Similarities in the history of barium accumulation provide a means of establishing an approximate chronology. The age model has been corroborated in one core by using the excess ^{230}Th method. The results indicate that glacial productivity was indeed lower south of the APF, confirming the observations of Mortlock et al., (1991) and Charles et al., (1991). This study extends knowledge of southern ocean sediment geochemistry and indicates that significant palaeoceanographic records addressing the glacial productivity hypothesis can be recovered from the deep Scotia and Weddell seas. (Auth. mod.)

Lara, R.J., Kattner, G., **Humic substances in the nitrogen cycle of polar waters. A comparison between the Arctic and Antarctic,** Humic substances in the global environment and implications on human health: proceedings of the 6th International Meeting of the International Humic Substances Society, Monopoli (Bari), Italy, September 20-25, 1992, edited by N. Senesi and T.M. Miano, Amsterdam, Elsevier, 1994, p.799-804, 20 refs.
DLC QD341.A2I55 1992

The contribution of humic substances to the dissolved nitrogen pool in antarctic and arctic waters is compared. Average dissolved organic nitrogen (DON) concentrations were similar in both regions (3-4 microM N). XAD-2 fractionation of dissolved organic matter showed that the hydrophobic acid fraction accounted for 20% of DON in the Antarctic (mean: 0.69 microM N) and 19% in the Arctic (mean: 0.77 microM N). The hydrophobic neutral fraction was 15% of DON in the Antarctic (mean: 0.5 microM N) and 25% in the Arctic (mean: 1.0 microM N). The hydrophilic fraction was ca. 60% of DON. (Auth.)

Rakusa-Suszczewski, S., **Environments of inlets, coves and lagoons in Admiralty Bay (South Shetland Islands, Antarctica),** Polar Symposium, 21st, Warsaw, Poland, Sep. 23-24, 1994. Sixty years of Polish research of Spitsbergen, edited by S.M. Zalewski, Warsaw, Polish Academy of Sciences, 1994, p.163-167, 25 refs.

Admiralty Bay is the largest bay in the South Shetlands, covering some 122 km^2; the main body of the bay covers 52.3% of this area, with Mackellar and Martel Inlets together constituting 31.5%, and Ezcurra Inlet the remaining 16.2%. The bay's mean depth is 198.6 m, with the deepest part attaining some 279.7 m; Ezcurra, Mackellar, and Martel Inlets are considerably shallower. These inlets form postglacial hanging valleys above the central basin of Admiralty Bay, the latter opening widely into the Bransfield Strait. About 30% of the bottom of Admiralty Bay is covered by macroalgae. Kelps are attached to the bottom to 90-100 m depth. The total biomass of macroalgae in the bay was estimated at approximately 74,000 tons. The type of substrata in Admiralty Bay also affects the specific composition of benthic fauna.

J-52219
Lipski, M., **Transport of metal elements from land to coastal zone of antarctic shelf waters,** Polar Symposium, 21st, Warsaw, Poland, Sep. 23-24, 1994. Sixty years of Polish research of Spitsbergen, edited by S.M. Zalewski, Warsaw, Polish Academy of Sciences, 1994, p.289-291.

In Feb. and Mar. of 1993, water samples from Admiralty Bay and its drainage basins were collected to determine whether streams and other freshwater inflows into the bay are increasing the water's concentration of some metal elements. No such evidence was found. The study was conducted on the hypothesis that traces of some metal elements in sea water can influence its primary productivity.

Stramma, L., Peterson, R.G., Tomczak, M., **South Pacific Current,** *Journal of physical oceanography,* Jan. 1995, 25(1), p.77-91, 37 refs.

The purpose of this paper is to determine if there is an identifiable current band associated with the South Pacific STF (Southern Hemisphere Subtropical Front) and, if so, how it compares with those in the South Atlantic and South Indian Oceans. It is found that such a current band does exist, though it is significantly weaker than in the other two basins. The flow associated with the STF in the Tasman Sea does not appear to be continuous with that in the remainder of the South Pacific, so the term "South Pacific Current" is used here for only the flow east of New Zealand. Eddy heat and salt fluxes into the northern Antarctic Circumpolar Current in the Atlantic and Indian sectors might have the cumulative downstream effect of causing the northern Antarctic Circumpolar Current entering the Pacific sector to be anomalously warm and salty. Hemispheric charts in the atlas by Gordon and Molinelli (1982) indicate that such is the case. The relative weakness of the South Pacific Current thus appears due to a combination of effects arising from geomorphology, vertical structure of the South Pacific subtropical gyre, and eddy heat and salt fluxes into the northern Antarctic Circumpolar Current in the other two basins. (Auth. mod.)

Blanchon, P., Shaw, J., **Reef drowning during the last deglaciation: evidence for catastrophic sea-level rise and ice-sheet collapse,** *Geology,* Jan. 1995, 23(1), p.4-8, 49 refs.

Elevations and ages of drowned *Acropora palmata* reefs from the Caribbean-Atlantic region document three catastrophic, meter-scale sea-level-rise events during the last deglaciation. These catastrophic rises were synchronous with (1) collapse of the Laurentide and antarctic ice sheets, (2) dramatic reorganization of ocean-atmosphere circulation, and (3) releases of huge volumes of subglacial and proglacial meltwater. This correlation suggests that release of stored meltwater periodically destabilized ice sheets, causing them to collapse and send huge fleets of icebergs into the Atlantic. Massive inputs of ice not only produced catastrophic sea-level rise, drowning reefs and destabilizing other ice sheets, but also rapidly reduced the elevation of the Laurentide ice sheet, flipping atmospheric circulation patterns and forcing warm equatorial waters into the frigid North Atlantic. (Auth. mod.)

Wang, Y.H., Dong, H.L., Ren, D.Y., **Chemical characteristics of sea water in the Prydz Bay, Antarctica,** *Antarctic research,* Dec. 1994, 5(2), p.58-66, 7 refs. For Chinese original see 22J-50446.

Based on data collected in the summer of 1989-90, the relationship between the distribution of nutrients and productivity in Prydz Bay is discussed. Outside of the Amery Ice Shelf area, a large expanse of warm water with a high nutrient content, where the dissolved oxygen is up to 120% and the chlorophyll *a* concentration is more than 1.00 mg/cu m, establishes Prydz Bay as a high productivity area. The vertical distribution of chemical elements merges with a spring-like temperature layer, resulting in an abnormal vertical distribution of nutrients at 350 m depth. There is no discernible spring salinity layer. Various factors causing the abnormal distribution are discussed. (Auth. mod.)

Determann, J., Grosfeld, K., Gerdes, R., Hinze, H., **Melting and freezing rates beneath Filchner-Ronne Ice Shelf from a 3D-ocean circulation model,** Filchner-Ronne Ice Shelf Programme, Report No.8 (1994), edited by H. Oerter, Bremerhaven, Alfred-Wegener-Institute for Polar and Marine Research, 1994, p.12-29, 15 refs.

Melting and ice accretion provide fresh-water fluxes as well as latent heat fluxes across the ice-shelf/ocean boundary, causing horizontal pressure gradients and initiating a so-called "thermohaline circulation" in the sub-ice-shelf cavity. By making use of a 3D ocean circulation model, the authors try to quantify the horizontal extent of melting and freezing areas below the FRIS. This becomes especially important because of the influence of melting and accretion on ice-shelf rheology. The formation of ISW (Ice Shelf Water), which is a source for AABW (Antarctic Bottom Water), makes the ice shelf-ocean interaction important for the global abyssal water mass distribution.

Fahrbach, E., Nixdorf, U., Oerter, H., Rohardt, G., **Tidal induced melting of the Ekström Ice Shelf in the southeastern Weddell**

Sea, Filchner-Ronne Ice Shelf Programme, Report No.8 (1994), edited by H. Oerter, Bremerhaven, Alfred-Wegener-Institute for Polar and Marine Research, 1994, p.20-23.

Interaction between ocean and ice shelf represents an important process of water mass formation and affects the stability and the development of an ice shelf. To investigate the relevant processes, CTD-measurements were carried out under the Ekström Ice Shelf in the southeastern Weddell Sea during austral summer 1992-93. The temperature and salinity profiles measured approximately 8 km in-shore from the edge of the ice shelf show a significant layering of the water column and time variability. Three distinct layers were observed. The top layer which is in contact with the base of the ice shelf extends approximately to 20 m. In this layer temperature and salinity normally increase continuously with depth. An intermediate layer with a thickness of about 50 m is characterized by a temperature maximum and salinity still increasing with depth. Depth and temperature of the maximum change significantly during a tidal cycle. In the bottom layer of about 100 m thickness, temperature and salinity increase with depth, however salinity has a weaker vertical gradient than in the upper layers. Due to the increasing salinity from top to bottom, the profile is stable in spite of the temperature inversion.

Hubberten, U., **Amino acids and humic substances in the nitrogen cycle of polar oceans** [Aminosäuren und Huminstoffe im Stickstoffkreislauf polarer Meere], *Berichte zur Polarforschung,* 1994, No.153, 123p., In German with English summary. Refs. p.114-123.

Changes of particulate and dissolved organic substances within the marine cycle were studied in the Arctic (Polarstern ARK VIII/I), the Antarctic (Polarstern ANT XI/1b) and in a phytoplankton culture experiment. The mechanisms and lability of the different XAD-2-resin fractions of DOM towards degradation were investigated. Samples from the Greenland Sea showed a highly significant inverse correlation for dissolved inorganic (DIN) and dissolved organic nitrogen (DON). Despite very different concentrations of DIN, the average DON concentrations were quite similar (ca. 3-4 mM N) in the Arctic and in the Antarctic. Humic fractions contributed 44% and 35% to DON in Arctic and Antarctic respectively. On average, 60% of DON was not associated with humic fractions. The mean concentration of DON-HbN in the Arctic (ca. 1 mM N) was nearly twice as high as in the Antarctic. The relative uniformity in DON fractions is in accordance with the hypothesis of an inert fraction of DOM, undergoing a multiple slow recycling in the ocean. In both sampling regions TDAA was about 11% of DON with a highly significant correlation for both variables.

Barber, M., Crane, D., **Current flow in the north-west Weddell Sea,** *Antarctic science,* Mar. 1995, 7(1), p.39-50, 39 refs.

Properties of the surface and bottom circulation in the northwest Weddell and south Scotia seas are examined. The bottom currents were recorded at heights from 5-800 m above the seabed, and surface velocities were obtained from the drift tracks of ARGOS buoys deployed in ice floes. The tidal regime is mixed and the power of motions at inertial frequencies is highly variable and most dominant in the Scotia Sea. Flow is influenced by topography, effects of which are seen in eddy features and the damping of inertial motions in some areas. The sea ice motion is shown to be influenced by the topography at very low frequencies whilst tidal periodicities observed in the northwestern Weddell Sea are below the noise threshold in the region of the study. In this area the higher frequency ice motion is mainly wind-driven with little of the energy being transferred to the underlying deep water. (Auth.)

Shiomoto, A., Ishii, H., **Distribution of biogenic silica and particulate organic matter in coastal and oceanic surface waters off the South Shetland Islands in summer,** *Polar biology,* Jan. 1995, 15(2), p.105-113, Refs. p.112-113.

Biogenic silica (BSi), lithogenic silica (LSi), particulate organic carbon (POC) and nitrogen (PON), and chlorophyll *a* (Chl *a)* concentration levels were measured in the surface waters (<100 m) off the northern coast of the South Shetland Is. in summer 1991. High concentration levels of BSi and LSi were recorded in the oceanic area and the coastal area, respectively. However, no marked regional differences were observed for POC, PON and Chl *a* concentrations. The mean BSi/POC atomic ratio (±SD) in the oceanic area was 6 times that in the coastal area, except for the bloom situation. In contrast, the mean POC/PON atomic ratio was not significantly different in the coastal (5.9±1.4) and the oceanic area (5.2±1.7). *Nitzschia* spp. were the dominant diatoms in the oceanic but not in the coastal area. High BSi/POC ratios have been reported for blooms dominated by *Nitzschia* spp. even in coastal regions. It is suggested that the area difference in the BSi/POC ratios is probably related to the difference in species composition of phytoplankton and not to regional contrast. (Auth. mod.)

Ishman, S.E., Domack, E.W., **Oceanographic controls on benthic foraminifers from the Bellingshausen margin of the Antarctic Peninsula,** *Marine micropaleontology,* Dec. 1994, 24(2), p.119-155, 54 refs.

Surface sediment samples collected from the Bellingshausen Sea continental margin of the Antarctic Peninsula were analyzed for benthic foraminifers. A total fauna including live and dead specimen counts was used to statistically identify discrete benthic foraminifer assemblages. Two major assemblages were defined: the *Bulimina aculeata* and *Fursenkoina* spp. Assemblages. The distribution of the *B. aculeata* and *Fursenkoina* spp. Assemblages are closely associated with the distribution of the two dominant bottom water masses on the continental margin, the Circumpolar Warm Deep Water and Weddell Sea Transitional Water. Their distributions cannot be related to organic carbon content or sediment texture of the surface sediments. The faunal composition of the Bellingshausen Sea margin assemblages and their water mass associations are similar to faunal-water mass relationships observed in the Weddell Sea and South Atlantic Ocean where *B. aculeata* is associated with Circumpolar Deep Water and *Nonionella iridea, N. bradii* and *Trifarina earlandi* are associated with Eastern Shelf and Modified Weddell Sea Water.

Feron, R.C.V., **Southern ocean western boundary currents: comparison of fine resolution antarctic model results with Geosat altimeter data,** *Journal of geophysical research,* Mar. 15, 1995, 100(C3), p.4959-4975, 52 refs.

Variability in the major western boundary current systems of the southern ocean is studied by comparing results from the United Kingdom fine resolution antarctic model (FRAM) to 3 years of Geosat altimeter data. The analysis results from the complex altimeter observations were verified, and the interpretation of Geosat data in the three southern ocean western boundary systems was improved. The hypothesis that ring formations can be catalogued and studied from variations in the decorrelation time of successive sea level anomaly fields is confirmed by FRAM. Applying the technique to altimeter data of the Agulhas, Brazil/Malvinas and East Australian Currents showed that quasi-periodic ring formations take place, roughly every 100, 150, and 130 days, respectively. The FRAM model only generated periodic ring formations in the Agulhas and East Australian Currents, both with a very regular 125 to 130 day period. This period is clearly a model-favored harmonic (1/3 year) which is, however, close to the observations. (Auth. mod.)

Akitomo, K., Awaji, T., Imasato, N., **Open-ocean deep convection in the Weddell Sea: two-dimensional numerical experiments with a nonhydrostatic model,** *Deep-sea research,* Jan. 1995, 42(1), p.53-73, Refs. p.72-73.

Numerical experiments with a two-dimensional nonhydrostatic model were carried out to investigate the generation processes of open-ocean deep convection, deep water formation and ventilation around the Maud Rise in the Weddell Sea. The thermobaric effect, i.e. an increase in the thermal expansion rate of sea water with pressure (water depth), is essential for the onset of deep convection in this region and for the overturning of the water column to occur abruptly. Thermal-like plumes induced by the thermobaric instability destroy the thermocline (halocline) and transport the cold and less-saline mixed layer water into the warm and more-saline underlying layer. Then the underlying water ascends to push the thermocline (halocline) up until it disappears at the sea surface. (Auth. mod.)

Diester-Haass, L., **Middle Eocene to early Oligocene paleoceangraphy of the Antarctic Ocean (Maud Rise, ODP Leg 113, Site 689): change from a low to a high productivity ocean,** *Palaeogeography, palaeoclimatology, palaeoecology,* Feb. 1995, 113(2-4), p.311-334, 63 refs.

The sediment record from the middle Eocene (about 45 Ma) to the early Oligocene (about 33 Ma) on Maud Rise Site 689, Weddell Sea (paleodepth 1400-1650 m), has been studied by means of a coarse fraction analysis in order to reconstruct variations in surface water productivity and bottom water masses. Productivity has been estimated using carbonate dissolution and accumulation rates of radiolaria, diatoms, benthonic and planktonic foraminifers, sponge debris, ostracods and echinoids. Accumulation rates of *Bolboforma* spp. vary parallel to these proxies. Productivity increased with time; three episodes were found in which productivity increased sharply, and productivity varied cyclically with a period of 430 ky. In the late Eocene-early Oligocene period, 34.95-33.05 Ma, a further increase in productivity led to a strong dissolution of planktonic foraminifers in high productivity periods. The productivity increase is probably due to the increasing pole-equator temperature gradient which led to stronger atmospheric and oceanic turnover and mixing in the oceans. (Auth. mod.)

Schlitzer, R., **Adjoint model for the determination of the mean oceanic circulation, air-sea fluxes and mixing coefficients** [Bestimmung von mittlerer ozeanischer Zirkulation, Oberflächenflüssen und Mischungskoeffizienten mittels der Adjungierten Methode], *Berichte zur Polarforschung,* 1995, No.156, 103p., With German summary. 54 refs.

The adjoint method has been successfully applied to obtain optimal circulation, air-sea fluxes and mixing coefficients that, in a steady model with exact mass, heat and salt conservation, can satisfactorily reproduce the measured distributions of temperature and salinity in the Atlantic. Profiles of horizontal velocities in the optimal model solution resemble initial geostrophic velocity profiles except for constant velocity shifts (the previously unknown reference velocities u_r) and the model circulation is considered to be consistent with the principle of geostrophy. Changes to the shapes of the geostrophic profiles can be controlled and kept small. The present method is a new approach to the classical problem of determining the reference velocities left unknown by pure geostrophic calculations. Here, the reference velocities are chosen such that the resulting circulation conserves field mass and leads to a correct prediction of temperature and salinity distributions in the ocean while satisfying heat and salt budgets exactly. The model is applied to the entire Atlantic Ocean from 80N through the Weddell Sea, about 70S. (Auth. Mod.)

Pérez, F.F., Tokarczyk, R., Figueiras, F.G., Ríos, A.F., **Water masses and phytoplankton biomass distribution during summer in the Weddell Sea marginal ice zone,** *Oceanologica acta,* 1994, 17(2), p.191-199, With French summary. 43 refs.

This study, carried out between the Elephant and the Orkney islands, showed that spatial variability in the marginal ice-edge zone (MIZ) was greater than that found in open sea. Salinity and silicate contents point to the existence of two fronts: the first, near Elephant I., separates the Surface Antarctic Water coming from Drake Passage from the winter water originating in the Weddell Sea. This water is characterized by its high concentrations of nitrate and silicates. The second front, near the South Orkney Is., which undergoes the influence by a less saline water lens, is poor in nutrients and rich in chlorophyll. Water mass circulation reveals the existence of a series of convergences and divergences which alternate along the MIZ, together with different haline fronts. (Auth. mod.)

Scarponi, G., Capodaglio, G., Toscano, G., Barbante, C., Cescon, P., **Speciation of lead and cadmium in antarctic seawater: comparison with areas subject to different anthropic influence,** *Microchemical journal,* Feb./Apr. 1995, 51(1/2), Hungaro-Italian Symposium on Spectrometry, 6th: Advances in Environmental Sciences, edited by G. Záray and T. Kántor, p.214-230, 25 refs.

The antarctic surface seawater of Terra Nova Bay was investigated by anodic stripping voltammetry (ASV) to study the distribution and complexation of lead and cadmium in an extremely remote region. Samples were analyzed to determine the total metal content, the metal distribution between free fraction and bound fraction, the content of ligands complexing metal, and the related conditional stability constants. Metal complexation was studied separately by titrating the sample with each of the metals and detecting the labile fraction by differential pulse anodic stripping voltammetry. Voltammetric titration data were processed according to the van den Berg-Ruzic procedure to determine metal complexation parameters. Results for lead and cadmium revealed the presence of one class of ligands. To evaluate the possible anthropic influence in metal content and speciation in seawater, antarctic results were compared to data obtained from the Pacific Ocean, the Atlantic Ocean, and the Adriatic Sea. The more significant findings include the different proportions of bound fractions of metals (70-80% in the Adriatic Sea compared to about 50% in antarctic waters). (Auth. mod.)

Troll, G., Matthies, D., Hofstetter, A., Skeries, W., **Recent and subrecent marine sediments of the north-western Weddell Sea and the Bransfield Strait, Antarctica,** *Polarforschung,* 1994 (Publ. 1992), 62(2/3), p.129-144, With German summary. 106 refs.

This paper gives a comprehensive petrological description of the marine sediments of the northwestern Weddell Sea, the Powell Basin, South Orkney Island Plateau and the Bransfield Strait. While looking to the total grain-size spectra and the petrological composition, which are in close relationship to each other, a reconstruction of the sedimentation conditions as well as the stratigraphical position of the sediment samples becomes possible. Moreover, some aspects of the geological setting of the hinterland can be deduced from the coarse grain and heavy mineral fractions. This is of utmost importance because of the lack of outcrops in the region. The area of investigation extends from 57° to 66° south latitude and 38° to 67° west longitude, and covers an area of about 2,000,000 km^2. The sea floor topography is quite well known and is described only very briefly. The investigated area can be subdivided into three sub-areas, of which the Bransfield Strait forms the southern part, the Powell Basin the middle, and the Weddell Sea the northern part. (Auth. mod.)

Bareille, G., Grousset, F.E., Labracherie, M., Labeyrie, L.D., Petit, J.R., **Origin of detrital fluxes in the southeast Indian Ocean during the last climatic cycles,** *Paleoceanography,* Dec. 1994, 9(6), p.799-819, 103 refs.

MS (magnetic susceptibility) flux profiles were used to examine the spatial and temporal detrital flux changes in this basin during the last climatic cycle. Results indicate a general increase in detrital material input during the coldest periods, suggesting a widespread phenomenon, at least on the basin scale. Mineralogical data, geochemical data, and $^{87}Sr/^{86}Sr$ isotopic ratios were used to determine the origin and transport mechanisms responsible for increased detrital flux during glacial periods. Tracers clearly indicate that the Crozet-Kerguelen province was a major source region of detrital in the western part of the basin during glacial times. In contrast, material of antarctic origin is well represented in the whole basin. Volcanic particles from Kerguelen and crustal particles from Antarctica were probably transported by the antarctic bottom water current and/or the circumpolar deepwater current during glacial periods, as is the case today. (Auth. mod.)

Ramsay, A.T.S., Sykes. T.J.S., Kidd, R.B., **Waxing (and waning) lyrical on hiatuses: Eocene-Quaternary Indian Ocean hiatuses as proxy indicators of water mass production,** *Paleoceanography,* Dec. 1994, 9(6), p.857-877, 109 refs.

On the basis of the temporal distribution of hiatus terminations, eight 3 m.y. time slices were selected for plotting the paleogeographical distribution of hiatus terminations. These distributions define areas of potential hiatus development, which formed along flow paths of proto-Antarctic Bottom Water and proto-Antarctic Intermediate Water. Expansion and contraction of these areas suggested changes in the volume of these water masses, which modified the distribution patterns of erosive deepwater currents and corrosive bottom water. Consequently, the spatial and bathymetric distribution of hiatus formation was altered. Age-depth analysis of hiatuses from sites within post-late Eocene areas of potential hiatus development was used, in conjunction with models of the behavior of unconformity boundaries within fluctuating water masses, to construct waxing/waning curves for proto-Antarctic Bottom Water and proto-Antarctic Intermediate Water. These curves define volume changes in the production histories of these water masses which were related to the post-late Eocene glacial history of Antarctica. (Auth. mod.)

Weber, M.E., Bonani, G., Fütterer, K.D., **Sedimentation processes within channel-ridge systems, southeastern Weddell Sea, Antarctica,** *Paleoceanography,* Dec. 1994, 9(6), p.1027-1048, 110 refs.

On the continental margin of the southeastern Weddell Sea several channel-ridge systems can be traced on the eastern side of the Crary Fan. The stratigraphy of recovered sediments there is based on accelerator mass spectrometer ^{14}C determinations, stable oxygen and carbon isotopes analyses and paleomagnetic measurements. The sediments represent a period from the last glacial maximum (LGM) to recent time. Four different sedimentary facies are distinguished and assigned to processes controlling sedimentation. A substantial environmental change at 19.5-20 ka is documented in the sediments by a gradual change from lamination to bioturbation. During the recent interglacial, bioturbated sediments were deposited in all parts of the terrace. Because of a reduction in contour current velocities, water masses of the Weddell Gyre gain a greater influence on sedimentation on the continental slope. (Auth. mod.)

Metzl, N., Poisson, A., Louanchi, F., Brunet, C., Schauer, B., Bres, B., **Spatio-temporal distributions of air-sea fluxes of CO_2 in the Indian and Antarctic oceans—a first step,** *Tellus,* Feb.-Apr. 1995, 47B(1-2), p.56-69, 23 refs.

Sea surface and atmospheric measurements of carbon dioxide fugacity (fCO_2) made during 14 cruises in 1991, 1992 and 1993 are used to describe the seasonal and meridional variation of air-sea CO_2 flux into the antarctic, subantarctic, subtropical and tropical regions of the Indian Ocean. Seasonal zonal averaged air-sea CO_2 fluxes from shipboard measured sea surface and atmospheric fCO_2 as well as observed ship winds are first estimated. Depending on the gas transfer coefficient used, a sink of -0.22 or -0.43 Gt carbon from Jan. to Sep. is calculated for the band 50°S-20°S. From June to Sep., the tropical region is a source between 0.04 and 0.08 GtC. From Jan. to May, the southern ocean is a sink between -0.01 and -0.03 GtC. Observed air-sea CO_2 flux calculations are compared with reconstructed sea surface fCO_2 distributions obtained from climatological data (SST and wind). By using the in-situ data obtained in 1991, large-scale seasonal relations between sea surface fCO_2 and sea surface temperature (SST) are extracted and applied to the 1992 monthly climatological SST fields in the 50°S-20°S region only. (Auth. mod.)

Schneider, B., Morlang, J., **Distribution of the CO_2 partial pressure in the Atlantic Ocean between Iceland and the Antarctic Peninsula,** *Tellus,* Feb.-Apr. 1995, 47B(1-2), p.93-102, 24 refs.

CO_2 partial pressure of surface water, $(pCO_2)_{sw}$, was measured continuously during two cruises in the Atlantic Ocean in Nov./Dec. 1991 and May 1992. A $(pCO_2)_{sw}$ profile between Iceland and the Antarctic Peninsula is obtained which demonstrates that along the investigated transect the Atlantic Ocean is largely a potential sink for atmospheric CO_2, especially at high latitudes, where partial pressure differences of -80 µatm to -100 µatm are observed. An attempt is made to identify the processes that control the $(pCO_2)_{sw}$ distribution pattern. Investigations at latitudes >40° in both hemispheres were performed during spring. Correlations between $(pCO_2)_{sw}$ and chlorophyll *a* contents indicate that biological production mainly controls the distribution of $(PCO_2)_{sw}$. At lower latitudes, $(pCO_2)_{sw}$ is mainly related to temperature and salinity, but also an upwelling effect could be identified close to the equator. (Auth. mod.)

Kuo, B.Y., Hung, S.H., Chiao, L.Y., **3-D dynamic model for the anomalous topography and geoid over the south-east Indian Ridge,** *Geophysical journal international,* Apr. 1995, 121(1), p.1-20, 43 refs.

The anomalous sea-floor topography and geoid height over the Australian-Antarctic Discordance (AAD) are examined and attributed to dynamic mantle flow in this study. The 3-D flow driven by the thermal anomaly is predominantly east-west oriented with a major downwelling near the AAD and its aged mantle. A simple formula is derived to estimate the mantle temperature beneath the ridge from the subsidence rates of topography and geoid for different corridors. This estimation yields a variation of about ±200°C, with the low near AAD and high at the segment to the east. The trend of variation is consistent with that from the dynamic modelling, and the magnitude is relatively high but favors the model in which the dynamic source is concentrated within the upper asthenosphere. The advection effect is estimated to cause a decay of the dynamic topography at a rate of the order of 0.005 km/Myr, making the downwelling die out very slowly with age. (Auth. mod.)

Romankevich, E.A., Peresypkin, V.I., **Dissolved and suspended particulate organic matter in antarctic waters of the Atlantic Ocean,** *Oceanology,* June 1994, 33(6), p.761-767, Translated from Okeanologiia. 10 refs.

On the basis of 332 analyses of dissolved (DOC) and particulate organic carbon (POC) taken from the surface to 4785 m depth at 10 stations in the Atlantic part of the southern ocean, the following regularities were determined: low DOC concentration, a sharp decrease in values in the upper 40-120 m, small changes deeper in the water column, a drop in concentrations in the Antarctic Divergence zone, the absence of a correlation between DOC and primary production of plankton. A decrease in average POC concentrations with depth when there is a small gradient in the 0-200 m water layer and an increase in POC concentrations in the pycnocline and during a phytoplankton bloom were found. The southern ocean is characterized, as a whole, by small POC concentrations close to the average values for the world's oceans. (Auth. mod.)

Amos, A.F., **RACER: Data reports,** *Antarctic journal of the United States,* 1993, 28(5), p.157-158, 4 refs.

The austral winter of 1992 saw the fourth and final field season of the RACER (research on antarctic coastal ecosystem rates) program. The RACER program study area was primarily the Gerlache Strait with some stations in the Bransfield Strait to the north and the Grandidier Channel to Marguerite Bay in the south. A table shows the details of each of the cruises. This article describes the availability of standard physical, chemical, and biological oceanographic station data as well as surface data (including meteorological parameters) when the ship was underway. The data reports are intended to disseminate the conventional oceanographic information.

J-52716

Amos, A.F., **RACER: The tides at Palmer Station,** *Antarctic journal of the United States,* 1993, 28(5), p.162-164, 6 refs.

In Jan. 1992, an ENDECO model 1029 water-level recorder was installed at the dock at Palmer Station. The goal of the project was to obtain tide data during the research on antarctic coastal ecosystem rates (RACER) and Antarctic Marine Living Resources (AMLR) projects. The pressure gauge is located at a mean depth of 3.275 m in a heavy-walled steel pipe welded to the dock bulkhead, and the recording module is mounted directly above it. The pipe acts as a stilling well. Differential pressure and sea temperature are recorded on a digital data cartridge at 10-min intervals. At monthly intervals, the cartridges are removed and read on-station using the personal computer reader/interface. The raw data record is "zipped" (compressed), encoded, and transmitted via e-mail to the University of Texas Marine Science Institute.

Tilbrook, B.D., Karl, D.M., **RACER: Methane enrichments in Port Foster, Deception Island,** *Antarctic journal of the United States,* 1993, 28(5), p.165-166, 14 refs.

During the RACER program, methane distributions in antarctic coastal waters of the Bransfield Strait, the Gerlache Strait, and in the southern oceans waters of the Drake Passage were examined. The objectives of the study were to identify the factors controlling methane distributions in antarctic shelf and open ocean environments and to evaluate the contribution these regions make to the sea-air flux of methane. As one small component of this larger study, the authors also occupied a single hydrostation in Port Foster, Deception I. They present the water-column methane distribution from this unique, partially submerged volcanic caldera and compare these values with samples collected in surrounding surface waters.

J-52733

Amos, A.F., **AMLR program: Interannual variability in the Elephant Island surface waters in the austral summer,** *Antarctic journal of the United States,* 1993, 28(5), p.201-204, 6 refs.

The austral summer of 1992-93 was the 4th field season of the U.S. AMLR program that included a physical oceanography component to study the Elephant I. regional hydrography. In this study, a preliminary evaluation of interannual variability in the upper water column was made using a simple quasivolumetric analysis technique. In total, 654 CTD stations were used in the analysis. A figure shows the temperature anomalies at the surface: 1990 and 1993 were warm years, whereas 1991 and 1992 were cold, 1992 being as much as 1.7°C cooler than 1990 in some locations and overall about 1°C cooler at the surface than 1990 and 1993. Differences were also recorded at other depths and in other parameters.

Hofmann, E.E., Lipphardt, B.L., Jr., Smith, D.A., Locarnini, R.A., **Palmer LTER: Hydrography in the LTER region,** *Antarctic journal of the United States,* 1993, 28(5), p.209-211, 8 refs.

From Mar. 25 to May 15, 1993 an extensive hydrographic survey was made of the Palmer long-term ecological research (LTER) peninsula grid as part of a multidisciplinary cruise aboard the R/V *Nathaniel B. Palmer.* The survey covered an area that extended about 900 km alongshore and about 200 km offshore along the western side of the Antarctic Peninsula. These measurements represent the first extensive hydrographic regional coverage of the area west of the Antarctic Peninsula, an area that extends from the Bransfield Strait to the Bellingshausen Sea. This article presents preliminary results from analysis of these hydrographic data.

J-52739

Houlihan, T., Karl, D.M., **Palmer LTER: Dissolved silicic acid-nitrate relationships during austral autumn 1993,** *Antarctic journal of the United States,* 1993, 28(5), p.219-221, 15 refs.

Vertical profiles of silicic acid concentrations along the 10 across-shelf LTER station transects, exemplified by selected data for LTER line 800, displayed systematic patterns of nutrient depletion with increasing distance from shore. Nitrate concentrations also revealed surface-water depletions but did not display the strong spatial coherence observed for silicic acid. Based on a model 2 linear regression analysis of water samples collected at all stations and water depths, the authors conclude that the LTER study region exhibits a potential for "excess" nitrate at total silicic acid depletion. This contrasts sharply with data collected from the Ross Sea, which exhibit a silicic acid excess.

Asper, V.L., Diercks, A.R., Karl, D.M., **Palmer LTER: The first profiles of marine snow aggregate abundance from Antarctica,** *Antarctic journal of the United States,* 1993, 28(5), p.223-225, 9 refs.

Large aggregates (termed "marine snow") have been shown to be important or even dominant in the vertical transfer of material from the euphotic zone to the seafloor. During a recent cruise to the Antarctic Peninsula area aboard the R/V *Polar Duke*, the authors collected the first marine snow abundance data from Antarctica using the noncontact photographic profiling system developed by Honjo et al. (1984). These profiles show some of the highest concentrations of aggregates ever recorded by this system and, in general, are characterized by relatively low numbers near the surface, increasing abundances with depth, and maximum abundances near the seafloor. This abrupt transition into an intense nepheloid layer has not been described elsewhere and may have resulted from the density stratification that characterizes this region. In each of these profiles, the record abundances of aggregates in the bottom nepheloid layer may be indicative of resuspension or lateral transport of phytoplankton debris.

Karl, D.M., Resing, J., Tien, G., Letelier, R., Jones, D., **Palmer LTER: Hydrogen peroxide in the Palmer LTER region. I. An introduction,** *Antarctic journal of the United States,* 1993, 28(5), p.225-226, 21 refs.

This is an introduction to three articles in this issue in which the authors present data on the distribution of H_2O_2 in the 200,000 sq. km. Palmer LTER study area. They summarize preliminary results on H_2O_2 sources and sinks for the local antarctic coastal region.

J-52743

Resing, J., Tien, G., Letelier, R., Karl, D.M., Jones, D., **Palmer LTER: Hydrogen peroxide in the Palmer LTER region. II. Water column distribution,** *Antarctic journal of the United States,* 1993, 28(5), p.227-229, 13 refs.

During the 1992-93 field season, the authors studied the seasonal variability of H_2O_2 in the surface waters of the Palmer LTER study region. Over 1,000 water samples were collected from 64°S to 68°S. The results to date suggest that H_2O_2 concentrations in the Palmer LTER region are lower than those observed in temperate and tropical marine habitats. Initial analyses of these data suggest that there is little variation in H_2O_2 concentrations over the course of the austral summer. Determination of the annual variability of H_2O_2 in this region with a winter cruise planned for Aug. 1993 will be important to supplement the current understanding of H_2O_2 dynamics in the region.

J-52744

Tien, G., Karl, D.M., **Palmer LTER: Hydrogen peroxide in the Palmer LTER region. III. Local sources and sinks,** *Antarctic journal of the United States,* 1993, 28(5), p.229-230, 7 refs.

During the austral spring and autumn LTER cruises aboard the R/V *Polar Duke,* in Nov. 1992 and R/V *Nathaniel B. Palmer* in Mar. through May 1993, the authors investigated selected sources and sinks of hydrogen peroxide in a variety of antarctic coastal habitats. These measurements constituted one component of the comprehensive study of H_2O_2 dynamics. The potential source terms evaluated were wet deposition (snow), glacial ice meltwater and land runoff, and *in situ* biological processes. It is concluded that both biological and photochemical sources and microbiological sinks of H_2O_2 must be considered in studies of southern ocean H_2O_2 dynamics.

Lynch-Stieglitz, J., Fairbanks, R.G., Charles, C.D., **Glacial-interglacial history of antarctic intermediate water: relative strengths of antarctic versus Indian Ocean sources,** *Paleoceanography,* Feb. 1994, 9(1), p.7-29, 37 refs.

Sediment cores from the southern continental margin of Australia are near the formation region of Antarctic Intermediate Water (AAIW) and Subantarctic Mode Water, and record the changes in these water masses from the last glacial maximum through the present. Carbon and oxygen isotopes were measured on the benthic foraminiferal species *Planulina wuellerstrorfi* for both the Recent and last glacial maximum sections of the cores and were then used to reconstruct temperature and carbon isotopic water column profiles. The glacial oxygen isotope profile indicates a vertical temperature structure for this region similar to that in today's Subantarctic Zone. Today, AAIW properties reflect contributions from cool fresh Antarctic Surface Waters (2/3) and warm salty waters from the Indian Ocean (1/3). Data in this study suggest a much reduced contribution of North Indian Ocean intermediate water to glacial AAIW relative to the contribution of Antarctic Surface Water. This fresher, cooler glacial AAIW would be distributed to the intermediate-depth ocean, thus decreasing the transport of salt produced in the North Indian Ocean to the rest of the world's oceans. Robinson, A., Makinson, K., Nicholls, K., **Oceanic environment beneath the northwest Ronne Ice Shelf, Antarctica,** *Annals of glaciology,* 1994, Vol.20, International Symposium on Antarctic Glaciology, 5th, Cambridge, England, Sep. 5-11, 1993. Proceedings, p.386-390, 19 refs.

Oceanographic data have been obtained from beneath the Ronne Ice Shelf at a site on the southeastern side of a sea-floor trough, the Ronne Depression. The data consist of 5 d of CTD profiling and a long-term temperature record from a thermistor cable. The water column was found to be composed of two layers: a cold buoyant layer of Ice Shelf Water (ISW) overlying a layer of unmodified Western Shelf Water (WSW). A change in the water column was observed on the last day of profiling, with the WSW layer thinning, a cold intrusion appearing directly above the WSW and the ISW becoming colder. In addition, on three profiles the ISW cooled further and increased in salinity, becoming apparently statically unstable. The temperature record from the thermistor cable confirms that the ISW layer occasionally becomes colder, with greater variation in temperature than seen on the CTD profiles. These low temperatures and high salinities are interpreted as indicating that water containing ice crystals in suspension has been advected beneath the site. (Auth.)

Schneider, W., Nishio, F., Yamanouchi, T., Watanabe, O., Masuko, H., **SST estimation within Syowa's station mask using MOS-1's visible and thermal infrared radiometers,** *International journal of remote sensing,* Mar. 10, 1995, 16(4), p.613-624, 8 refs.

Since Feb. 1989, measurements from Marine Observatory Satellite 1 (MOS-1) have been received at Showa Station. The first set of MOS-1 visible and thermal infrared recordings from Showa is analyzed in this study. A method developed by Schüssel and Grassl is applied for ice and cloud filtering. For clear ocean pixels the sea surface temperatures are estimated by applying Muneyama's split window algorithm. A sea surface temperature composite of ten VTIR passes is presented. (Auth. mod.)

Gornitz, V., **Sea-level rise: a review of recent past and near-future trends,** *Earth surface processes and landforms,* Feb. 1995, 20(1), p.7-20, Refs. p.18-20.

Recently reduced sea level rise (SLR) estimates are based on climate models that predict a zero to negative contribution to SLR from Antarctica. Most global climate models (GCMs) indicate an ice accumulation over Antarctica, because in a warmer world, precipitation will exceed ablation/snow-melt. However, the impacts of attritional processes, such as thinning of the ice shelves, have been downplayed according to some experts. Furthermore, not all climate models are in agreement. Opposite conclusions may be drawn from the results of other GCMs. In addition, the West Antarctic Ice Sheet is potentially subject to dynamic and volcanic instabilities that are difficult to predict. Because of the great uncertainty in SLR projections, careful monitoring of future sea-level trends by upgraded tide-gauge networks and satellite geodesy will become essential. (Auth. mod.)

Abollino, O., Aceto, M., Sacchero, G., Sarzanini, C., Mentasti, E., **Determination of copper, cadmium, iron, manganese, nickel and zinc in antarctic sea water. Comparison of electrochemical and spectroscopic procedures,** *Analytica chimica acta,* Apr. 20, 1995, 305(1-3), p.200-206, 10 refs.

Different procedures for the determination of ultratrace metal ions in antarctic sea water have been adopted and critically compared. The investigated metal ions were Cd, Cu, Fe, Mn, Ni and Zn. Sea water samples were analyzed with adsorptive cathodic stripping voltammetry and with graphite furnace atomic absorption spectroscopy. Different treatments, such as UV irradiation, acidification and on-line sample enrichment were adopted. Results for samples collected in different sites and on a vertical profile are discussed and compared. (Auth.)

Mantyla, A.W., Reid, J.L., **On the origins of deep and bottom waters of the Indian Ocean,** *Journal of geophysical research,* Feb. 15, 1995, 100(C2), p.2417-2439, Refs. p.2438-2439.

The characteristics of the deep and bottom waters of the Indian Ocean, when illustrated on potential-density anomaly surfaces, indicate that the waters enter from both the Atlantic and Pacific Oceans. The paths of spreading are constrained by the complex topography, and characteristics are altered by exchange with the overlying and underlying water and with the sediments, especially in the northern Indian Ocean. The Weddell Sea contributes to the densest waters found in the western basins and the Ross Sea and Adélie Coast to the densest waters found in the eastern basins. Both dense water varieties are altered by and incorporated in the less dense water above; initially, water carried by the circumpolar current, then water from the north Atlantic, and finally by deep water whose characteristics are derived in the northern Indian Ocean. (Auth. mod.)

Dafner, E.V., Selin, P.IU., **Organic matter in waters of the SW Atlantic sector of the southern ocean,** *GeoJournal,* Jan. 1995, 35(1), p.71-77, 30 refs.

The 25th cruise of R/F *Akademik Knipovich* in Jan.-Apr. 1990 comprised investigations of total organic carbon (TOC) at the following sections: through the Polar Frontal Zone (PFZ) along 40°W; from the PFZ to the South Orkney Is., and on the South Georgia shelf. The measurements made comprised TOC, organic nitrogen, nitrate, nitrite, ammonium nitrogen, phosphate and silicate. The surface waters of the region were characterized by high heat content, which influenced the antarctic phytosynosis function. The data obtained showed low content of organic matter (OM); high content of TOC, rising up to 3.5 mg/m^3, was recorded at the photic layer and in the layer of OM accumulation, at the upper boundary of the Antarctic Deep Waters and the vertical boundaries of the Antarctic Intermediate Waters. The South Georgia shelf waters showed even distribution of TOC, about 0.2 mg/m^3, being under the influence of the south periphery of ACC waters. (Auth.)

Odate, T., Fukuchi, M., **Physical and chemical properties of surface water in the southern ocean in summer 1991/92,** NIPR Symposium on Polar Biology, Proceedings. No.8, Tokyo, National Institute of Polar Research, Jan. 1995, p.77-85, 15 refs.

Surface water temperature and salinity were continuously recorded in the southern ocean during the JARE-33 cruise in summer of 1991-92. Concentrations of nitrate-N plus nitrite-N and silicate-Si were also determined. Three oceanographic fronts were recognized based on the physical variables: the Subtropical Convergence, the Subantarctic Front, and the Antarctic Polar Front. Large meridional gradients of nutrient concentrations were observed in the fronts. The nutrient conditions are summarized as follows: Subtropical zone, both nutrient concentrations are below threshold; Subantarctic Zone, nitrate plus nitrite is several μM but silicate is still below threshold; Polar Frontal Zone, the former reaches ca. 20 μM and the latter increases several μM; Antarctic Zone, the former is ca. 20 μM and the latter is over 20 μM. (Auth. mod.)

Odate, T., Fukuchi, M., **Distribution and community structure of picophytoplankton in the southern ocean during the late austral summer of 1992,** NIPR Symposium on Polar Biology, Proceedings. No.8, Tokyo, National Institute of Polar Research, Jan. 1995, p.86-100, Refs. p.98-100.

In summer of 1992, three major oceanographic fronts, the Antarctic Polar Front, the Subantarctic Front, and the Subtropical Convergence, were recognized based on the degree of latitudinal gradients of surface water temperature and nutrient concentrations. These fronts divide the area into four distinct zones: the Antarctic Zone (ANZ), Polar Frontal Zone (PFZ), Subantarctic Zone (SAZ), and Subtropical Zone (STZ). Chlorophyll *a* concentration retained on a glass fiber filter (bulk CHL) was the most abundant in the SAZ. Although the bulk CHLs in the surface waters of the other water masses were almost the same, ca. 0.3 μg/l, the percent contributions of the pico fraction (less than 2 μm) were different: 74±5% (STZ), 43±11% (PFZ), and 23±11% (ANZ). The cell density of cyanobacteria (CY) was greater than that of other picophytoplankton (OP) north of the Subantarctic Front. The lowest cell densities of CY and OP were found in the surface water of the ANZ, the highest were noted in the SAZ. (Auth. mod.)

Harada, N., Handa, N., Fukuchi, M., Ishiwatari, R., **Source of hydrocarbons in marine sediments in Lützow-Holm Bay, Antarctica,** *Organic geochemistry,* Mar. 1995, 23(3), p.229-237, 54 refs.

This paper attempts to reconstruct the paleoenvironment of the coastal region around Showa Station using organic compounds in marine sediments. A 129 cm long core sample of the oceanic sediment was collected in Lützow-Holm Bay. ^{14}C age showed a smooth pattern of change from about 3000 BP at the surface to 14,000 BP at the bottom, except for a change of age in the range of 80-120 cm depth. n-C_{21} was dominant in the low hydrocarbon content sections at the depths of 0-5, 60-65 and 120-125 cm of the core, whereas long-chain alkanes (C_{22}, C_{23}, C_{24}) were dominant in the high hydrocarbon content sections at depths of 45-50 and 90-95 cm. These characteristic distribution patterns of *n*-alkanes suggest that their major source probably is mixed altered and/or recycled material and recent organic material possibly derived from marine organisms. The differences in the δ^{13}C values of individual alkanes from the high and low hydrocarbon content sections of the core were not appreciable, suggesting a common source for these compounds. δ^{13}C values for organic matter in different sections of the core range from -26.0 to -28.5 per mill, indicating that its major source is marine organisms. Hellmer, H.H., Jacobs, S.S., **Seasonal circulation under the eastern Ross Ice Shelf, Antarctica,** *Journal of geophysical research,* June 15, 1995, 100(C6), p.10,873-10,885, 42 refs.

An annual cycle of shelf water temperatures and salinities measured at depth near the eastern Ross Ice Shelf front is used to force a two-dimensional thermohaline circulation model adapted to different sub-ice paths in the vicinity of Roosevelt I. These paths were assumed to have constant water column thicknesses of 160, 200, and 240 m and lengths of 460-800 km. Model results were compared with other long-term measurements that showed outflow from beneath the ice shelf. The ice shelf base loses mass at a rate of 18-27 cm/yr, with seasonal forcing increasing the spatial and temporal variability of circulation and property distributions in the larger cavities. Shallow cavities reduce the influence of shelf water variability with increasing length. Introducing a transient shelf water temperature rise of 0.01°C/yr for 100 years increases the melt rate by 4-5 times. (Auth. mod.)

Hubberten, U., Lara, R.J., Kattner, G., **Refractory organic compounds in polar waters: relationship between humic substances and amino acids in the Arctic and Antarctic,** *Journal of marine research,* Jan. 1995, 53(1), p.137-149, 26 refs.

A synopsis of data on the amino acid compositions of arctic and antarctic seawater, CAD-fractions of dissolved organic matter (DOM) and suspended particulate organic material (POM) is presented. Total dissolved amino acids (TDAA) correlated highly significantly with dissolved organic nitrogen (DON), representing about 11% of DON in unfractionated filtered seawater. Average DON values were similar with ca. 3-4 μM N in the Arctic and Antarctic. Differences in amino acid distribution and composition patterns in particulate and dissolved material suggest the selective preservation or utilization of certain amino acids. In both regions, at the surface ca. 60%, and at depths >500 m almost 100% of TDAA is found in the "humic" fractions. A background value of TDAA of around 200 nM, mostly contained in the hydrophobic neutral (HbN) fraction, is present throughout the water column, probably forming part of recalcitrant molecules. The relation of these findings to different humification mechanisms is discussed. (Auth. mod.)

Frew, R.D., Heywood, K.J., Dennis, P.F., **Oxygen isotope study of water masses in the Princess Elizabeth Trough, Antarctica,** *Marine chemistry,* Apr. 1995, 49(2-3), p.141-153, 25 refs.

Data from a hydrographic survey located in the Princess Elizabeth Trough near the antarctic continent are presented and discussed. This region is covered by sea-ice for most of the year with the ice-edge retreating to the southern edge of the Trough during summer. Water samples were collected during the austral summer, Feb. 1993, to determine the ratio of the oxygen-18 to oxygen-16 isotope, δ^{18}O. Four water bodies are characterized by their temperature, salinity and δ^{18}O properties, Surface Water, Winter Water, Warm Deep Water and Bottom Water. The Bottom

Water is warmer, saltier and heavier isotopically than Weddell Sea Bottom Water, and has T-S properties close to that of classical Antarctic Bottom Water. This Bottom Water is isotopically distinct from the Weddell Sea-derived Bottom Water that ventilates the Indian Ocean through the Kerguelen-Crozet gap. A mechanism for local formation of the Bottom Water involving freezing of Surface Water and entrainment of Warm Deep Water is described. (Auth. mod.)

Abouchami, W., Goldstein, S.L., **Lead isotopic study of circum-antarctic manganese nodules,** *Geochimica et cosmochimica acta,* May 1995, 59(9), p.1809-1820, 55 refs.

Presented here are lead isotope ratios of Mn nodules from the circum-antarctic ocean, which links the Atlantic, Indian, and Pacific. The circum-polar antarctic was chosen for this study because of its relatively simple circulation pattern and its importance as a link between the oceans. The samples analyzed cover the whole perimeter around Antarctica, both north and south of the mean position of the Subtropical Convergence at 40°S, which represents the northern boundary of the circum-antarctic ocean. Chow and Patterson (1959, 1962) showed that the concentration of Pb in both Mn nodules and pelagic sediments is generally a factor of 10-100 higher than in continental detritus, hence the Pb is primarily derived from seawater. The primary aims of this study are to constrain the provenance of Pb in different regions of the circum-antarctic and examine the relationship between the isotope variations and general present-day ocean circulation. (Auth. mod.)

J-53194

Marshall, D., **Topographic steering of the Antarctic Circumpolar Current,** *Journal of physical oceanography,* July 1995, 25(7), p.1636-1650, 34 refs.

An analytic model of the Antarctic Circumpolar Current (ACC) is presented in which information contained in a hydrographic section is propagated along characteristics. The characteristics are obtained by assuming that potential vorticity is uniform on density surfaces, lying between the *f*/H contours found in a homogeneous ocean and the *f* contours found in a strongly stratified ocean. A family of solutions are obtained for a realistic spherical geometry including coastlines and major topographic features. In the limit of weak bottom currents, the ACC transports 160 Sv of fluid around Antarctica, with circumpolar flow in the upper 3 km and abyssal gyres bounded by the bottom topography. In the limit of large bottom currents, the ACC exhibits increased sensitivity to the topography; streamlines resemble *f*/H contours and do not pass through the Drake Passage. (Auth. mod.)

McTaggart, A.R., Burton, H.R., Nguyen, B.C., **Emission and flux of DMS from the Australian antarctic and subantarctic oceans during the 1988/89 summer,** *Journal of atmospheric chemistry,* Jan. 1995, 20(1), p.59-69, 26 refs.

DMS (dimethyl sulfide) emissions and fluxes from the Australasian sector of the antarctic and subantarctic oceans were determined from a limited number of samples collected during three summer resupply voyages to Australian antarctic continental research bases between Nov. 1988 and Jan. 1989. The maximum DMS emission from this sector of the antarctic ocean was in an area near the Antarctic Divergence, while the minimum DMS emission was from the antarctic coastal and offshelf waters. The greatest emission of DMS from this sector of the southern ocean was from subantarctic waters. The flux of DMS from the Australasian sector of the subantarctic ocean was probably twice the flux of DMS from the adjacent antarctic ocean. (Auth. mod.)

Rosenthal, Y., Boyle, E.A., Labeyrie, L.D., Oppo, D., **Glacial enrichments of authigenic Cd and U in subantarctic sediments: a climatic control on the elements' oceanic budget?,** *Paleoceanography,* June 1995, 10(3), p.395-413, 73 refs.

Examined here is the possibility that glacial increase in the areal extent of reducing sediments might have changed the oceanic Cd inventory, thereby decoupling Cd from PO_4. It is suggested that the precipitation of Cd-sulfide in suboxic sediments is the single largest sink in the oceanic Cd budget and that the accumulation of authigenic Cd and U is tightly coupled to the organic carbon flux into the seafloor. Sediments from the subantarctic ocean and the Cape Basin (South Atlantic), where oxic conditions currently prevail, show high accumulation rates of authigenic Cd and U during glacial intervals associated with increased accumulation of organic carbon. These elemental enrichments attest to more reducing conditions in glacial sediments in response to an increased flux of organic carbon. A third core shows an approximately inverse pattern to the subantarctic record. The contrasting patterns to the north and south of the Antarctic Polar Front suggest that higher accumulation rates of Cd and U in subantarctic sediments were driven primarily by increased productivity. (Auth. mod.)

J-53276

Shopova, D., Dehairs, F., Baeyens, W., **Simple model of biogeochemical element distribution in the oceanic water column,** *Journal of marine systems,* June 1995, 6(4), p.331-344, 40 refs.

A simple technique for data analysis of the distribution of biogeochemical elements in the oceanic water column is presented. It is based on a steady vertical model, which assumes that the turbulent diffusion and vertical advection are the main physical mechanisms influencing the conservative tracer concentration. The production/consumption rates of non-conservative tracers are computed on the basis of this model. Sensitivity analysis of the model has been performed, which permits assessing the eventual influence of horizontal advection on the results. It also permits the taking into account of its effects if some hypothesis for the horizontal gradients is made. The potential area of applicability for data analysis is broad. Examples of its application are presented as analysis of oxygen data for some stations of the INDIGO3, 1987 expedition in the southern ocean. The calculated oxygen consumption rates for the Antarctic Circumpolar Current (Indian Ocean Sector) range between 1.8 and 2.22 mmol/m^2/d±20%. (Auth.)

J-53278

Singer, A.J., Shemesh, A., **Climatically linked carbon isotope variation during the past 430,000 years in southern ocean sediments,** *Paleoceanography,* Apr. 1995, 10(2), p.171-177, 43 refs.

The isotopic composition of carbon from organic matter enclosed within diatom frustules is used as a proxy for paleoproductivity and paleodissolved carbon dioxide concentrations in ocean surface waters. A southern ocean record from south of the Antarctic Polar Front and spanning 430,000 years of carbon isotopic variation in diatomaceous organic matter is presented for the first time. The most refractory diatomaceous organic matter fraction was extracted and analyzed to avoid problems associated with diagenesis. The results clearly indicate cyclic changes in organic carbon isotopic ratios, with ^{13}C depleted values associated with all of the last five glacial periods, reflecting changes in surface water properties and primary productivity. Changes in dissolved carbon dioxide concentrations are the most probable cause of these cycles, but the possible effect of seawater pH changes cannot be excluded. (Auth.)

J-53279

Shemesh, A., Burckle, L.H., Hays, J.D., **Late Pleistocene oxygen isotope records of biogenic silica from the Atlantic Sector of the southern ocean,** *Paleoceanography,* Apr. 1995, 10(2), p.179-196, 23 refs.

Analytical reproducibility and core-to-core consistency of the isotopic signal suggests that diatom $\delta^{18}O$ can be used as a new paleoceanographic tool to reconstruct past variations in surface water characteristics and to generate ^{18}O-isotope-based stratigraphy for the southern ocean. Diatom $\delta^{18}O$ reflects sea surface temperature and seawater isotopic composition; diatoms retain their isotopic signal on timescales of at least 430 ka. The $\delta^{18}O$ analyses of different diatom assemblages reveal that the isotopic signal is free of species effects and that common antarctic species have the same water-opal fractionation. The transition from the last glacial maximum (LGM) to the Holocene is fully recorded in high sedimentation rate cores. (Auth. mod.)

Mead, G.A., Hodell, D.A., **Controls on the $^{87}Sr/^{86}Sr$ composition of seawater from the middle Eocene to Oligocene: Hole 689B, Maud Rise, Antarctica,** *Paleoceanography,* Apr. 1995, 10(2), p.327-346, 85 refs.

A $^{87}Sr/^{86}Sr$ isotope curve of the middle Eocene to Oligocene was produced from analysis of foraminifera in Ocean Drilling Program Hole 689B, Maud Rise, near the coast of Antarctica. Sediments from the hole are well preserved with no evidence of diagenetic alteration. The sequence is nearly complete from 46.3 to 24.8 Ma, with an average sampling interval of 166 kyr. Marine strontium isotopic ratios were nearly stable from 46.3 to 35.5 Ma. The slope remained constant at least until 24.8 Ma, when the record becomes discontinuous owing to unconformities. Several possible controls on the marine strontium isotope curve are evaluated that could have led to the observed growth in $^{87}Sr/^{86}Sr$ ratios near the Eocene/Oligocene boundary, including the onset of antarctic glaciation, increased mountain building in the Himalayan-Tibetan region, and decreased hydrothermal activity. A combination of causes, such as decreased hydrothermal activity perhaps followed by increased glaciation and mountain building, might best explain the growth of the marine $^{87}Sr/^{86}Sr$ curve during the Oligocene. (Auth. mod.)

Grose, T.J., Johnson, J.A., Bigg, G.R., **Comparison between the FRAM (Fine Resolution Antarctic Model) results and observations in the Drake Passage,** *Deep-sea research, Part I,* Mar. 1995, 42(3), p.365-388, 34 refs.

The velocity and density fields generated by the Fine Resolution Antarctic Model (FRAM) are compared with observations made in the neighborhood of the Drake Passage. Detailed comparisons are presented for the jets along the Subantarctic Front, the Polar Front and the Continental Water Boundary. As the position of the Antarctic Circumpolar Current is mainly topographically controlled, the consequences of smoothing the topography in numerical models are discussed. The transport through the Drake Passage in FRAM is about 180 Sv, about 50 Sv higher than the most recent observations. Reasons for this discrepancy between observations and primitive equation models are discussed. The smoothed topography has forced the Polar Front to divide and merge with the Subantarctic Front and the Continental Water Boundary Front, but cold core current rings are still shed from the Polar Front meander as in the observations. (Auth.)

Toggweiler, J.R., Samuels, B., **Effect of Drake Passage on the global thermohaline circulation,** *Deep-sea research, Part I,* Apr. 1995, 42(4), p.477-500, 38 refs.

The Ekman divergence around Antarctica raises a large amount of deep water to the ocean's surface. The regional Ekman transport moves the upwelled deep water northward out of the circumpolar zone. The divergence and northward surface drift combine, in effect, to remove deep water from the interior of the ocean. This wind-driven removal process is facilitated by a unique dynamic constraint operating in the latitude band containing Drake Passage. A simple model sensitivity experiment shows that the upwelling and removal of deep water in the circumpolar belt may be quantitatively related to the formation of new deep water in the northern North Atlantic. These results show that stronger winds in the south can induce more deep water formation in the north and more deep outflow through the South Atlantic. The fact that winds in the Southern Hemisphere might influence the formation of deep water in the North Atlantic brings into question long-standing notions about the forces that drive the ocean's thermohaline circulation. Foster, T.D., **Abyssal water mass formation off the eastern Wilkes Land coast of Antarctica,** *Deep-sea research, Part I,* Apr. 1995, 42(4), p.501-522, 21 refs.

The area off the eastern Wilkes Land coast between 147 and 162°E has been investigated as a site for the formation of bottom and deep water using seven hydrographic sections obtained in the austral summer 1985. The sections showed that there was high salinity water near the freezing point upon the continental shelf in this region. The deeper shelf water was potentially more dense than the water off the shelf, but a reversely sloping shelf and the Coriolis effect constrain this water from flowing off continuously. Since the sections are very similar to those found in the southern Weddell Sea, it is proposed that the same mechanisms that are probably responsible for shelf-break mixing and bottom water formation in the Weddell Sea also take place here. Most of the water on the shelf above the shelf-break sill depth, while not dense enough to form true bottom water, potentially could mix with the Warm Deep Water and interleave with water off the shelf at intermediate and near-bottom depths. Thus this region may contribute to what is commonly denoted as Antarctic Bottom Water as effectively on an areal basis as the shelf-break region of the Weddell Sea. (Auth.)

Barrera, E., **Global environmental changes preceding the Cretaceous-Tertiary boundary: early-late Maastrichtian transition,** *Geology,* Oct. 1994, 22(10), p.877-880, 22 refs.

Stable carbon, oxygen, and strontium isotope data from Maastrichtian planktic and benthic foraminifera from southern high-latitude Ocean Drilling Program Sites 690, 750, and 761 reveal major changes in climate and ocean chemistry during the early to late Maastrichtian transition, some 4 to 6 m.y. prior to the Cretaceous-Tertiary (K-T) boundary. The $\delta^{18}O$ results suggest accelerated cooling, resulting in the lowest marine temperatures of the Late Cretaceous. The late Maastrichtian rise in the seawater $^{87}Sr/^{86}Sr$ ratio begins at the time of this change and suggests increased rates of continental weathering and/or runoff. The $\delta^{13}C$ values show a negative shift of ≈ 0.5 per mill followed by a positive shift of ≈ 1 per mill. The $\delta^{13}C$ fluctuations may reflect change in deep water chemistry with cooling, variation in reduced carbon storage in coastal areas caused by eustatic sea-level fluctuation, and increased surface-water productivity. These findings contradict the common representation of stable and climatically equable environmental conditions in the latest Cretaceous before the K-T boundary event. (Auth.)

German, C.R., Masuzawa, T., Greaves, M.J., Elderfield, H., Edmond, J.M., **Dissolved rare earth elements in the southern ocean: Cerium oxidation and the influence of hydrography,** *Geochimica et cosmochimica acta,* Apr. 1995, 59(8), p.1551-1558, 28 refs.

Analysis of dissolved REE distributions in the southeastern Atlantic Ocean has revealed that progressive oxidative removal of dissolved Ce from deepwater (>1 km) occurs over the mixing time of the oceans. Ce-anomaly (Ce/Ce*) values measured in deep waters from the southeastern Atlantic are similar to, but slightly higher than, those from deep-ocean stations throughout the Indian and Pacific oceans, typically falling in the range $0.08 \leq Ce/Ce^* \leq 0.12$. Only deepwater samples from the North Atlantic exhibit values greater than $Ce/Ce^* \approx 0.12$, with the exception of southeastern Atlantic bottom water which are influenced by Antarctic Bottom Water (AABW). Covariation of dissolved REE concentrations with salinity and/or dissolved Si concentrations at this site has allowed dissolved REE compositions for various southern ocean water masses to be predicted. End-member concentrations for AABW derived in this way indicate high dissolved REE concentrations, similar to average Pacific Deep Water, but with significantly enhanced dissolved Ce concentrations and less pronounced HREE enrichment. This result is consistent with the proximity of the study site to active AABW deepwater formation and evolution of that water mass during transport to the Pacific Ocean. (Auth.)

Szeliga, J., Rakusa-Suszczewski, S., **Morphometry of Bransfield Strait, West Antarctica,** *Polish polar research,* 1994, 15(1-2), p.21-29, With Polish summary. 3 refs.

On the basis of approx. 12,500 depth measurements of which 6700 were taken from R/V *Profesor Siedlecki,* 1300 from R/V *Polarstern* and the remainder from British navigation charts, a bathymetric chart of the Bransfield Strait in the scale 1:500,000 has been prepared. Within the assumed boundaries the total area of the Bransfield Strait covers 65,308.6 sq km, of which the Western Basin covers 23.5%, Central Basin, 47.3%, and Eastern Basin, 29.2%. Capacity of the entire Bransfield Strait amounts to 38,451 km^3. The average depth of the Bransfield Strait is 592 m. (Auth. mod.)

Acosta, J., Herranz, P., Sanz, J.L., Uchupi, E., **Antarctic continental margin: geologic image of the Bransfield Trough, an incipient ocean basin,** Geologic evolution of Atlantic continental rises, edited by C.W. Poag and P.C. de Graciansky, New York, Van Nostrand Reinhold, 1992, p.49-61, 32 refs.

DLC QE350.2.G45 1992

Seismic reflection profiles from this study and data obtained during previous studies indicate that the Bransfield Trough is a continental rift structure in transition to becoming an oceanic one. The asymmetry of the trough suggests that it is a half-graben structure, whose master fault is on the Antarctic Peninsula side, away from the zone of subduction. The fault is opposed by a platform, the South Shetland Is. Ridge. This tectonic model, however, needs verification. At present, the spreading axis in the Bransfield Trough consists of discrete igneous centers separated by gaps that may have allowed sediments from Antarctica to reach the northwest side of the trough. Continuity of the axis also is interrupted by structures aligned transversely to the trough axis. The intersection of these cross-structures with features parallel to the trough axis appears to be sites of pronounced magmatic activity. If the 30 km-wide Bransfield Trough is representative of conditions that exist when deposition changes from synrift to drift (postrift), then the authors can make some inferences regarding the analogous Jurassic/Cretaceous transitions in the North and South Atlantic. Above all, data show that the transition from rift to drift may be commonly marked by a complex distribution of synrift and postrift lithofacies. (Auth. mod.)

Döös, K., **Interocean exchange of water masses,** *Journal of geophysical research,* July 15, 1995, 100(C7), p.13,499-14,514, 13 refs.

A new method for calculating water mass transport between different ocean basins from the velocity fields obtained by numerical models is presented. The method is applied to the velocity field of the southern ocean simulated by a primitive equation model (Fine Resolution Antarctic Model). With this model it is possible to judge whether a water mass has been ventilated or not, to estimate how many times it has circled around Antarctica, and to calculate the time it has spent in the southern ocean. Calculations have also been undertaken revealing to what extent the changes of temperature, salinity, and density have been caused by mixing and by ventilation. Two major ways to redistribute the water through the southern ocean are identified. The first one redistributes 53% of the water and involves an unventilated direct exchange between the oceans; the second one redistributes 33% by going around Antarctica. It is found that, on average, the water mass makes six circuits before the water is ventilated and subsequently driven north by the Ekman transport. (Auth. mod.)

Gordon, A.L., Huber, B.A., **Warm Weddell Deep Water west of Maud Rise,** *Journal of geophysical research,* July 15, 1995, 100(C7), p.13,747-13,753, 15 refs.

A pool of relatively warm (>1.0°C) Weddell Deep Water (WDW) immediately west of Maud Rise appears to be a quasi-stationary feature. The "warm pool" is derived from the flow of warm WDW around the flanks of Maud Rise. An austral spring 1989 expedition of the R/V *Akademik Fedorov* obtained detailed measurements of this warm pool. It displays the general regional relationship of temperature maximum warmth to shallowness of the pycnocline, as well as mixed layer oxygen concentration well below full saturation. Depression of oxygen values is a product of injection of WDW into the mixed layer during the ice-covered winter period. Associated with this transfer are high vertical fluxes of heat and salt which limit the thickness of the sea ice cover. In the winter the atmosphere is sufficiently cold to remove the WDW heat without massive sea ice melting, though the regional ice thickness is restricted. In the spring the atmospheric conditions cannot remove the ocean heat, and ice melting ensues before the atmospheric heat budget alone can account for the ice melt. This is clearly seen in the warm pool as very low mixed layer oxygen, which is a reflection of high WDW entrainment and vertical heat flux and is normally associated with high mixed layer salinity. Imbrie, J., et al, **On the structure and origin of major glaciation cycles. 1. Linear response to Milankovitch forcing,** *Paleoceanography,* Dec. 1992, 7(6), p.701-738, Refs. p.733-738.

Time series of ocean properties provide a measure of global ice volume and monitor key features of the wind-driven and density-driven circulations over the past 400,000 years. Cycles with periods near 23,000, 41,000, and 100,000 years dominate this climatic narrative. When the narrative is examined in a geographic array of time series, the phase of each climatic oscillation is seen to progress through the system in essentially the same geographic sequence in all three cycles. This paper maintains that the 23,000- and 41,000-year cycles of glaciation are continuous, linear responses to orbitally driven changes in the arctic radiation budget, and uses the phase progression in each climatic cycle to identify the main pathways along which the initial local responses to radiation are propagated by the atmosphere and ocean. Niebler, H.S., **Reconstruction of paleoenvironmental parameters using stable isotopes and faunal assemblages of planktonic foraminifera in the South Atlantic Ocean** [Rekonstrucktionen von Paläo-Umweltparametern anhand von stabilen Isotopen und Faunen-Vergesellschaftungen planktischer Foraminiferen im Südatlantik], *Berichte zur Polarforschung,* July 1995, No.167, 198p., In German with English summary. Refs. p.128-141. The work is the author's dissertation submitted to the University of Bremen in 1994.

Changes in surface water hydrography in the southern ocean (eastern Atlantic sector) are reconstructed on the basis of isotope-geochemical and micropaleontological studies. A total of 75 high quality multicorer sediment surface samples from the southern South Atlantic Ocean and three Quaternary sediment cores, taken on a meridional transect across the Antarctic Circumpolar Current, were investigated. The reconstruction of environmental parameters indicates only small changes in the position of the frontal systems in the eastern sector of the Antarctic Circumpolar Current during the last 140,000 years. The average position of the Subtropical Front and Subantarctic Front shifted approximately three latitudes between interglacials and glacials. The Antarctic Polar Front shifted approximately four latitudes. Substantial modifications of this scenario have been interpreted for the reconstruction of cold sea-surface temperatures at 41°S during the oxygen isotope stages 16 and 14 to 12. During these times the Subtropical Front was probably shifted up to seven latitudes northwards. (Auth. mod.)

Kennicutt, M.C., II, et al, **Human contamination of the marine environment—Arthur Harbor and McMurdo Sound, Antarctica,** *Environmental science & technology,* May 1995, 29(5), p.1279-1287, 31 refs.

Polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCBs), pesticides, and trace metal concentrations in McMurdo Sound and Arthur Harbor sediments and marine biota are reported. Biomarkers of contaminant exposure, biliary metabolites and EROD assays were also measured. Hydrocarbon and trace metal contamination are generally limited to within hundreds of meters of human settlements. Local releases of fossil fuels, disposal of waste materials, and aging of ship and station structures contribute to contamination. High concentrations of PCBs were detected in sediments (250-4200 ng/g) and organisms (up to 420 ng/g) from Winter Quarters Bay (WQB). Trace metal and PAH sediment concentrations rarely exceed levels known to cause toxic effects in marine organisms, whereas PCBs in WQB often do. Biological responses to exposure include the formation of PAH metabolites and the inducement of the P4501A detoxification system in fish. Induction of EROD activity in *in vitro* rat hepatoma H411E cell bioassays by tissue extracts correlated with known levels of PCB contamination in invertebrate tissues. Local sources of contaminants greatly exceed those attributable to long-distance atmospheric transport. (Auth.)

Toggweiler, J.R., Samuels, B., **Effect of sea ice on the salinity of antarctic bottom waters,** *Journal of physical oceanography,* Sep. 1995, 25(9), p.1980-1997, Refs. p.1996-1997.

Brine rejection during the formation of antarctic sea ice is known to enhance the salinity of dense shelf waters in the Weddell and Ross seas. As these shelf waters flow off the shelves and descend to the bottom, they entrain ambient deep water to create new bottom water. It is not uncommon for ocean modelers to modify salinity boundary conditions around Antarctica in an attempt to include a "sea ice effect" in their models. However, the degree to which antarctic salinities are enhanced is usually not quantified or defended. In this paper, studies of shelf hydrography and $\delta^{18}O$ are reviewed to assess the level of salinity enhancement appropriate for ocean general circulation models. The relevant quantities are: the salinity difference between the water masses modified on the shelves and the final offshelf flow, and the flux of salt (or freshwater) that gives rise to this salinity difference. Onshelf/offshelf salinity changes in the Weddell and Ross seas appear to be fairly small, 0.15-0.20 salinity units. The quantity of brine needed to produce this salinification is equivalent to the salt drained from <0.50 m of new sea ice every year. The authors conclude that salt from sea ice is probably not a major influence on the salinity of antarctic bottom waters. (Auth. mod.)

Pierce, D.W., Barnett, T.P., Mikolajewicz, U., **Competing roles of heat and freshwater flux in forcing thermohaline oscillations,** *Journal of physical oceanography,* Sep. 1995, 25(9), p.2046-2064, Refs. p.2063-2064.

The physical mechanisms causing century-scale southern ocean thermohaline oscillations in a primitive equation oceanic general circulation model are described. The oscillations have been shown to occur on a 320 year timescale when random fluctuations are added to the freshwater flux field that forces the model; this result is extended to show that they occur in a variety of situations, including ones without added noise. The oscillations involve movement between two model states: one characterized by strong convection and an active thermohaline circulation, and the other with a halocline around Antarctica capping off the water column, thus preventing convection. The physical mechanism that forces the model from the quiescent state to an actively convecting one is subsurface (300 m) heating around Antarctica, which destabilizes the water column; the ultimate source of this heat is advected North Atlantic Deep Water. This leads to a teleconnection between forcing conditions in the North Atlantic and the thermohaline structure of the southern ocean. The mechanism that shuts off convection is surface freshening, primarily by precipitation, in the region poleward of the Antarctic Circumpolar Current. (Auth. mod.)

Guretskiĭ, V.V., Danilov, A.I., Shtammer, D., **Movement of eddies of the Antarctic Circumpolar Current at the eastern boundary of the Weddell Gyre, as indicated by satellite altimetry,** *Russian Academy of Sciences. Transactions. Earth science sections,* 1992 (Pub. Sep. 1994), 325A(6), p.228-232, Translated from Rossiĭskaia Akademiia Nauk. Doklady. For Russian original see 49-1369 or J-51654. 10 refs.

Heat and salt are carried into the antarctic zone of the southern ocean (south of the Antarctic Polar Front) by Circumpolar Water down to 200 to 3000 m depth. Eddy structures generated on the southern periphery of the Antarctic Circumpolar Current are likely to make a major contribution to the development of meridional transport of temperature and salinity characteristics, feeding the Circumpolar Water and affecting the distribution of drifting ice. (Auth. mod.)

Power, S.B., **Climate drift in a global ocean general circulation model,** *Journal of physical oceanography,* June 1995, 25(6), p.1025-1036, 53 refs.

A global version of the GFDL modular ocean model is forced using conventional restoring boundary conditions (BCs), mixed BCs (i.e., restoring the upper-level temperature but specifying a fixed salt flux), and stochastic fluxes of both heat and freshwater. The climatology of the model drifts if stochastic freshwater fluxes are applied at high latitudes under mixed BCs. The drift is global in extent: the ocean is generally warmer in the North Pacific and Weddell Sea but cooler and fresher at depths elsewhere in the southern ocean and in the North Atlantic. There is a slight reduction (by about 5%) in the meridional overturning of the southern ocean and the North Atlantic. The drift of the barotropic flow is most pronounced in the southern ocean and is associated with a permanent meandering of the Antarctic Circumpolar Current. The drift occurs within a few decades, suggesting that it may be important in enhanced greenhouse scenarios for early next century that have been obtained using coupled atmosphere-ocean GCMs. (Auth. mod.)

Hughes, T.M.C., Weaver, A.J., **Multiple equilibria of an asymmetric two-basin ocean model,** *Journal of physical oceanography,* Mar. 1994, 24(3), p.619-637, 42 refs.

An ocean general circulation model is used to examine the role of model geometry and surface buoyancy and wind stress forcing in the asymmetry of the global thermohaline circulation. The model domain is a highly idealized Atlantic and Pacific, linked by a circumpolar ocean in the south. The integrations are performed under mixed boundary conditions diagnosed from spinups under various temperature and salinity profiles constructed from present-day climatology. The model exhibits a tendency to favor either a "conveyor"-type circulation with sinking in the northern North Atlantic and upwelling in the North Pacific, or a "southern sinking" state with deep sinking in the Antarctic only. Equilibria with northern sinking in both basins can appear, however, when the winds in the southern ocean are reduced or the horizontal or vertical mixing in that region is tampered with. Three alternate two-basin geometries also have both "northern sinking" and "inverse conveyor" solutions. The common characteristic of all the North Pacific sinking states is the appearance of a very fresh halocline in the southern ocean that strongly reduces the Antarctic Circumpolar Current and reverses the sign of the normal pole-to-pole surface density contrast in the Pacific. (Auth. mod.)

Muench, R.D., Gordon, A.L., **Circulation and transport of water along the western Weddell Sea margin,** *Journal of geophysical research,* Sep. 15, 1995, 100(C9), p.18,503-18,515, 27 refs.

Ocean current, temperature and salinity data obtained from the western Weddell Sea during the austral winter 1992 U.S.-Russian drifting ice station experiment Ice Station Weddell 1 are used to describe water circulation and transport. Surface-to-bottom baroclinic currents were computed by applying the geostrophic approximation to derived density data. These were corrected using current measurements obtained from drifting current meter arrays, and the resulting total currents were vertically integrated to obtain volume transports. Transport was found to be northward in the region, which encompassed the western boundary current of the cyclonic Weddell Sea gyre. This northward transport increased from south to north by more than a factor of 2. The increase in northward transport was compensated for by westward flow from the interior of the gyre into the western boundary region. A thick bottom layer of cold water was identifiable by its water mass characteristics as Weddell Sea Bottom Water originating on the southwestern and western shelf regions. Its north flowing volume was consistent with past estimates of a 1.5-2 x 10^6 m^3/s production rate coupled with a 300-400% transport increase due to entrainment during downslope flow from the shelves to the deep basin. (Auth. mod.)

Robertson, R., Padman, L., Levine, M.D., **Fine structure, microstructure, and vertical mixing processes in the upper ocean in the western Weddell Sea,** *Journal of geophysical research,* Sep. 15, 1995, 100(C9), p.18,517-18,535, 50 refs.

The upward flux of heat from the subsurface core of Warm Deep Water (WDW) to the perennially ice-covered sea surface over the continental slope in the western Weddell Sea is estimated using data obtained during Feb.-June 1992 from a drifting ice station. The diapycnal heat flux is estimated to be about 3 W/m^2, predominantly because of double-diffusive convection. The estimated mean rate of heat transfer from the mixed layer to the ice is 1.7 W/m^2. It is hypothesized that isopycnal mixing along sloping intrusions also contributes to the loss of heat from the WDW in this region. Intrusions occur intermittently throughout this experiment but are most commonly found near the boundary of the warm-core current and the shelf-modified water to the east. These heat fluxes are significantly lower than the basin-averaged value of 19 W/m^2 that is required to balance the heat budget of the Weddell Gyre. (Auth. mod.)

Boddem, J., Schlitzer, R., **Interocean exchange and meridional mass and heat fluxes in the South Atlantic,** *Journal of geophysical research,* Aug. 15, 1995, 100(C8), p.15,821-15,834, 31 refs.

The purpose of the present study is to investigate the time mean circulation in the South Atlantic and to address the controversy on possible flow patterns and transport rates. As a tool, the model approach of Sehlitzer [1993] is used. The historical database of temperature and salinity measurements (more than 15,000 stations in the South Atlantic) is exploited and an optimal steady state model circulation is sought that is consistent with geostrophic shear calculations and is able to reproduce the measured temperature and salinity distributions. Model setup and strategy are described, then it is shown that a steady flow field with mainly geostrophic velocity shear and realistic model θ and s distributions can actually be found. Model calculations with additional *a priori* volume and heat flux constraints show that the overall model objectives can be met by a variety of significantly different circulation patterns. These alternative model solutions are also presented. (Auth. mod.)

Vogeler, A., Schröter, J., **Assimilation of satellite altimeter data into an open ocean model,** *Journal of geophysical research,* Aug. 15, 1995, 100(C8), p.15,951-15,963, 35 refs.

Geosat sea-surface height data are assimilated into an eddy-resolving quasi-geostrophic open ocean model using the adjoint technique. The method adjusts the initial conditions for all layers and is successful on a timescale of a few weeks. Time-varying values for the open boundaries are prescribed by a much larger quasi-geostrophic model of the Antarctic Circumpolar Current (ACC). Both models have the same resolution, have three layers, and include realistic bottom topography and coastlines. The open model box is embedded in the African sector of the ACC. These results are used for the adjoint optimization procedure as boundary conditions and as a first guess for the initial condition. Several experiments which attempt to improve the convergence of the iterative optimization method are reported. (Auth. mod.)

Fahrbach, E., Rohardt, G., Scheele, N., Schröder, M., Strass, V., Wisotzki, A., **Formation and discharge of deep and bottom water in the northwestern Weddell Sea,** *Journal of marine research,* July 1995, 53(4), p.515-538, 38 refs.

Deep and bottom water formation in the Weddell Sea is the major source of the bottom water of the world ocean. Measurements made in the northwestern Weddell Sea between 1989 and 1993 during the Weddell Gyre Study indicate that the outflow of young bottom water with the western boundary current of the Weddell Gyre is dominated by a rather fresh water mass which obtains its thermohaline characteristics by mixing of deep water with a flow from the shelf in front of the Larsen Ice Shelf. The more saline source water mass, which is necessary to maintain the thermohaline properties of the Weddell Sea Deep Water, is less prominent in the bottom water outflow. The transport of bottom water with the western boundary current of the Weddell Gyre ranges from 1 to $4x10^6$ m^3/s. The outflow is subject to a seasonal cycle with minimum temperatures and maximum velocities in early austral winter. (Auth.)

Frew, R.D., **Antarctic bottom water formation and the global cadmium to phosphorus relationship,** *Geophysical research letters,* Sep. 1, 1995, 22(17), p.2349-2352, 25 refs.

Near-surface waters close to the antarctic continent are found to have high cadmium concentrations relative to phosphorus. These waters have been shown to be the major component in the local formation of Antarctic Bottom Water in this region. It is demonstrated that Antarctic Bottom Water so formed would have a high preformed cadmium-to-phosphorus ratio. The ventilation of the abyssal ocean with this water would contribute to the observed kink in the global cadmium-to-phosphorus relationship. This is an important conclusion for paleochemical studies and may account for part of the discrepancy between cadmium and carbon-13 paleochemical tracers observed in the southern ocean. (Auth. mod.)

Arzhanova, N.V., Zubarevich, V.L., Naletova, I.A., **Forms of occurrence of nitrogen in the Southern Atlantic,** *Oceanology,* 1990 (Pub. June 1991), 30(6), p.690-695, Translated from Okeanologiia. 6 refs.

DLC GC1.O3913

The lateral distribution of mineral and organic nitrogen and their ratios in the water column in the latitude zones of the South Atlantic Ocean are discussed. Total mineral nitrogen decreases greatly from the Antarctic to the equator (from 15-30 to 1 µg-atom/l in the euphotic zone), but organic nitrogen remains at essentially the same level in all water types. High levels of organic nitrogen (greater than, respectively, 30 and 20 µg-atom/l) at the surface and in the depths) occur in regions of downwelling (the Antarctic Convergence zone and the tropical anticyclone). The contributions of urea nitrogen and amino acid nitrogen to total organic nitrogen vary greatly, from 5% to 30% and 20%, respectively, indicating a change in the character of organic matter in the water column. Shapiro, G.I., Emel'ianov, M.V., **Relationship between characteristics of the mesoscale and the fine structure in the antarctic polar front zone,** *Oceanology,* Mar.-Apr. 1994, 34(2), p.180-185, Translated from Okeanologiia. 13 refs.

The mesoscale and fine structure of the thermohaline field in the frontal zone north of South Georgia I. are investigated. The parameters of the main fronts, meanders and isolated cold patches are determined. Absolute and relative mesoscale characteristics of the polar front zone (PFZ) are analyzed and their relations with fine structure parameters are revealed. A method of quasispectral analysis of thermohaline fine structure is proposed. This method makes it possible to calculate the thickness of the layer of vertical movements and the intensity of diapycnal and isopycnal mixing. It is shown that the weak stratification of the antarctic waters to the south of the PFZ corresponds to the intensity of diapycnal processes. (Auth. mod.)

Results of investigations on ecological, hydrological and hydrochemical water structure properties of the southern ocean are reported. The papers are grouped under the following subtitles: oceanographic features responsible for the distribution, state and variability of the pelagic communities; ecology of plankton populations and groups; seasonal succession in the antarctic and subantarctic communities; and production of some planktonic groups and trophic relationships in the pelagic ocean. A review by the editor of antarctic pelagic investigations with reference to literature data (25 references) concludes this volume.

DLC QH84.2.P45

Ocean surface and deep water salinity and temperature fields and their seasonal variations and circulation were constructed for the area of 50°S, from the Antarctic Peninsula to 40°E. At the northeastern border of the Weddell Gyre, the highest temperature values are found at 500 m depth, while in the central portion of the Gyre they are found at depths <300 m. At the southwestern border of the Gyre a water temperature of 0.2-0.4° is found at 700 m depth. Graphs of the Gyre's barotropic circulation, temperature and salinity distribution at different water depths are presented. The data show that the Weddell Gyre is a single circulatory system.

Edited by N.M. Voronina, Moscow, Nauka, 1993, p.83-90, In Russian. 5 refs.

DLC QH84.2.P45

Data on water dynamics and structure over the shelf, slope and deep-water part of the Cosmonaut Sea are considered in an attempt to explain the absence of icefish *(Chaenodraco wilsoni)* concentrations on Ledyanaya Bank in Jan. and their appearance there in Mar. 1985, as well as the mechanism of "hydrodynamic trap" formation over the shelf banks. It is concluded that the pattern of icefish distribution in the shelf zone in different years is likely to be associated with arrival of transformed deep water to the shelf zone and temperature inversion in the near-bottom layer, which creates conditions favorable for the formation over the shelf banks of "hydrodynamic traps" capable of accumulating krill in the upper layer and enabling their downward movement to the near-bottom layer where they are fed on by the icefish.

Lanin, V.I., **Oceanographic preconditions for fish productivity formation and ichthyocene composition on islands and seamounts** [Okeanograficheskie predposylki formirovaniia ryboproduktivnosti i sostava ikhtiotsena v raĭonakh ostrovov i podvodnykh gor IUzhnogo okeana], Pelagicheskie ekosistemy IUzhnogo okeana: sbornik nauchnykh trudov (Pelagic ecosystems of the southern ocean: collected scientific papers). Edited by N.M. Voronina, Moscow, Nauka, 1993, p.90-96, In Russian. 9 refs.

DLC QH84.2.P45

It is believed that predominance of bottom fishes in the ichthyofauna of antarctic waters and adaptation of these species to feeding on pelagic macroplankton (mainly euphausiids) are associated with a permanently acting complex of abiotic and biotic factors underlying the mechanism of fish productivity formation. Long-term investigations in the Indian sector of the southern ocean suggest that practically the same hydrodynamic and hydrophysical processes occur over the Ob and Lena banks, in the shelf and slope areas of Kerguelen and Heard islands and over the antarctic continental slope and shelf banks. These processes lead to the concentration of pelagic macroplankton over bottom elevations and its subsequent sinking to near-bottom layers inhabited by fishes (Notothenidae, Channichthyidae). The combined effect of bottom topography and transformation of antarctic water structure is considered in detail.

DLC QH84.2.P45

Sep.-Dec. 1993 surveys of the area 26-40°W, 48'52°S made it possible to observe the process of nutrients uptake by phytoplankton during the vegetation period. Particular attention was paid to the southern boundary of the Polar Frontal Zone (PFZ), where the PFZ waters come into contact with the Weddell Sea water of the high-latitude modification. Data on the contents of phosphates, nitrates, Si and oxygen saturation are analyzed in relation to phytoplankton development. Based on changes of Si content in the photic layer (50 m) over the period Oct. 12 to Dec. 2, the daily production of phytoplankton is estimated at 0.8 gC/m^2, which is comparable to that in highly productive regions of the World Ocean.

Edited by N.M. Voronina, Moscow, Nauka, 1993, p.134-140, In Russian. 4 refs.

DLC QH84.2.P45

The potentialities of laser phytoplankton fluorescence diagnostics are discussed, and a shipborne lidar used during the 43rd cruise of the R/V *Dmitriĭ Mendeleev* in Jan.-May 1989 is briefly described. The lidar was used to study horizontal variation in the fluorescence fields of surface phytoplankton, to measure vertical distribution profiles of phytoplankton fluorescence intensity and temporal variations of different scales (days, weeks, months). Continuous en route (3500 km) monitoring of horizontal phytoplankton fluorescence distribution provides support for the hypothesis that an active role in the formation of macroscale distributions in the surface layer is played by wind mixing. For the first time data were obtained on not only local (1 km) and mesoscale (10 km) but also macroscale (100 km) variations of phytoplankton fluorescence fields in the Atlantic sector of the Antarctic.

Silva S., N., Helbling, E.W., Villafañe, V.E., Amos, A.F., Holm-Hansen, O., **Variability in nutrient concentrations around Elephant Island, Antarctica, during 1991-1993,** *Polar research,* June 1995, 14(1), p.69-82, 54 refs.

The nutrient status of the various water mass structures within a large sampling grid around Elephant I. are reported and the nutrient concentrations relative to data from the physical and biological components of the Antarctic Marine Living Resources Programme are discussed. Samples were taken from eleven depths at 17 stations in 1991, at four depths at 144 stations in 1992 and 182 stations in 1993. There was considerable variability in the concentrations of all three nutrients within the study area, but silicic acid showed the greatest variance among the water masses present in the sampling grid. The ratios of the nutrient deficits (difference in winter and summer values) in the upper 100 m differed considerably in Drake Passage waters as compared to Bransfield Strait waters, with both nitrate and silicic acid showing the greatest variance. Nutrient deficits did not increase from Jan. to Feb., indicating that rates of replenishment of nutrients to the euphotic zone by physical processes and/or biological regeneration were approximately equal to the rate of uptake and assimilation by phytoplankton during that time period. (Auth. mod.)

DiTullio, G.R., Smith, W.O., Jr., **Relationship between dimethylsulfide and phytoplankton pigment concentrations in the Ross Sea, Antarctica,** *Deep-sea research, Part I,* June 1995, 42(6), p.873-892, 58 refs.

Although relatively low chl *a* levels were encountered in Ross Sea measurements, the DMS inventory in the photic zone ranged from 81 to 3484 μmol/m^2. In comparison, the DMSO$_p$ standing stock was very low and accounted for only 11% of the average integrated DMS concentration. DMS:chl *a* ratios were significantly higher in waters dominated by *Phaeocystis antarctica* compared to diatom-dominated waters. A strong DMS gradient was observed from south to north with the highest DMS concentrations measured in the southern Ross Sea and the lowest observed in the northern Ross Sea. Areas with high fucoxanthin:chl *a* ratios were associated with relatively low DMS concentrations as compared to areas with high HEX:chl *a* ratios. There was no significant linear relationship, however, observed between DMS and HEX, chl *a*, or primary productivity in waters where *P. antarctica* dominated. In contrast, a significant correlation was observed between DMS and chl *a* in the northern Ross Sea where diatoms dominated and where the DMSP$_p$:DMS ratio was the highest. (Auth. mod.)

Orsi, A.H., Whitworth, T., III, Nowlin, W.D., Jr., **On the meridional extent and fronts of the Antarctic Circumpolar Current,** *Deep-sea research, Part I,* May 1995, 42(5), p.641-673, 74 refs.

The geopotential anomaly of the sea surface relative to 1000 db reveals the highly-sheared eastward flow of the ACC and the strong steering of the current by the ridge system around Antarctica. The near-surface property distributions differentiate the ACC waters from the warmer and saltier waters of the subtropical regimes. The subtropical Front (STF) marks the northernmost extent of subantarctic waters. Distributions of properties on isopycnal surfaces show an abrupt end to the characteristic signal of the Upper Circumpolar Deep Water (UCDW), as this water mass shoals southward and is entrained into the surface mixed layer. This sharp water mass boundary nearly coincides with the southernmost circumpolar streamline passing through Drake Passage. To its south are the weakly-sheared circulations of the subpolar regime. The poleward edge of the UCDW signal is a reasonable definition of the southern boundary of the ACC. At Drake Passage, three deep-reaching fronts account for most of the ACC transport. Well-established indicators of the Subantarctic Front and Polar Front are traced unbroken around Antarctica. The third deep-reaching front observed to the south of the Polar Front at Drake Passage also continues with similar characteristics as a circumpolar feature. (Auth. mod.)

Antarctic oceanography, Regional oceanography: an introduction; by M. Tomczak and J.S. Godfrey, Oxford, UK, Elsevier, Ltd., 1994, p.67-87, Refs. p.397-409.

DLC GC11.2.T66 1994

Southern ocean is used as a convenient term to describe the sea water south of the variable Subtropical Front. This body of water encompasses 77 million sq km of surface area, about 22% of the surface of the World Ocean. At various depths it has direct access to all other oceanic regions except the Arctic. Other terms are used to denote other aspects of the southern ocean, such as the Antarctic and Subantarctic Fronts, the Antarctic Convergence and Divergence; in reality, these regions are quite variable and complex both within themselves and in relation to each other: they move with the tides and currents. Other topics bearing on the southern ocean include precipitation and ice, hydrology and water masses, zonal and meridional flow of currents and movements of water masses. The combined effect of consistently high wind speeds, little variation in wind direction, and no land barriers to impede the build-up of a fully developed sea, makes the southern ocean the global region having the highest average wave height. All of these features of the southern ocean tend to highlight the complex nature of the waters surrounding the antarctic continent.

Turner, D.R., Owens, N.J.P., **Biogeochemical study in the Bellingshausen Sea: overview of the STERNA 1992 expedition,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.907-932, Refs. p.930-932.

A general overview and background of a two-ship study to examine biogeochemical fluxes in the marginal ice-zone of the Bellingshausen Sea, SE Pacific sector of the southern ocean is presented. The major feature studied was an intense band of chlorophyll that was found geographically close to a receding ice-edge. However, the bloom appeared not to be a result of a shallow mixed layer caused by ice-melt stabilization, but rather associated with an oceanic front that coincided with the ice-edge. Details of the hydrographic conditions existing along the 85°W meridian from the ice-edge to open water to the north, and detailed surveys of surface hydrographic conditions, are presented. (Auth.)

Read, J.F., Pollard, R.T., Morrison, A.I., Symon, C.J., **On the southerly extent of the Antarctic Circumpolar Current in the southeast Pacific,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.933-954, Refs. p.953-954.

A front at 67°S in the Bellingshausen Sea at 85°W is shown to be part of the Antarctic Circumpolar Current (ACC) and the southernmost zone of concentrated eastward transport at that longitude. The front lies 6° south of the Polar Front at 88°W and 3° north of the Continental Water Boundary. The front is continuous to the east through Drake Passage where it forms a southern branch of the Polar Front, for which reason the authors have named it the Southern Polar Front. Data from a towed profiling CTD were able to distinguish the Polar Front from the Southern Polar Front, even though they were only 0.5° apart. Thus the width of the ACC south of the Polar Front varies considerably. About a third of the transport of the ACC also lay south of the Polar Front, with 15 Sv carried by the Southern Polar Front alone at 85°W. Distinguishing features of the Southern Polar Front were a water mass boundary associated with a zone of concentrated baroclinic flow and a surface salinity minimum. These features also have been found at the Greenwich Meridian at 53°S, so the Southern Polar Front can be traced round at least a quarter of the globe. (Auth. mod.)

J-53842

Pollard, R.T., Read, J.F., Allen, J.T., Griffiths, G., Morrison, A.I., **On the physical structure of a front in the Bellingshausen Sea,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.955-982, Refs. p.980-982.

The structure of a front observed at 67°S in austral spring in the Bellingshausen Sea is described. A seasonal halocline was present throughout the survey area on both sides of the front, at the base of a mixed layer 50-70 m deep. The signature of the previous winter's mixed layer depth could be seen in the weak stratification between 70 and 150 m. The subsurface temperature minimum within the winter mixed layer was significantly colder south of the front (-1.7°C) than north of it (-1.1°C). The front, defined by eastward velocities greater than 10 cm/s, was 70-80 km wide with flow at speeds of up to 50 cm/s in the surface layer. The zone within which water mass changes occurred was narrower, about 40 km, contained within the zone of eastward flow and extending down to 1000 m. The strong velocities in the frontal jet caused differential advection of surface properties from upstream (west) of the survey area, resulting in sharp cross-frontal gradients of salinity and chlorophyll *a*. Chlorophyll was largest (over 5 mg/m^3) in a band barely 10 km wide that extended along-front for well over 100 km and was tightly constrained along the southern flank of the front where isopycnals outcropped from the winter mixed layer into the surface layer across the seasonal halocline. Sagan, S., Weeks, A.R., Robinson, I.S., Moore, G.F., Aiken, J., **Relationship between beam attenuation and chlorophyll concentration and reflectance in antarctic waters,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.983-996, Refs. p.995-996.

Optical and biological data collected during the two-month R.R.S. *Discovery* expedition in antarctic waters in the austral spring were used to examine the relationships between *c* (660 nm), chlorophyll *a* and the reflectance ratios R(443)/R(550), R(490)/R(550) and R(443 nm). Values of (c-c_w) (660 nm) varied from 0.20 to 1.2/m, being generally positively correlated with the chlorophyll concentration. The computed values of the pigment specific beam attenuation coefficient c^* were greater than those typical in Case I waters, exceeding 0.9 m^2/mg, reducing the accuracy of the chlorophyll remote sensing algorithms designed for Case I waters. The covariance of phytoplankton and related pigments with beam attenuation was examined by the regression equation $c-c_w=A+B(\text{Chl } a+\text{phaeo})$, and the residuals were used to identify the non-chlorophyll dependent data in the region. When the non-chlorophyll dependent data were removed, the accuracy of the chlorophyll remote sensing model was significantly improved. (Auth.)

Weeks, A.R., et al, **Distribution of acoustic backscatter from zooplankton compared with physical structure, phytoplankton and radiance during the spring bloom in the Bellingshausen Sea,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.997-1019, Refs. p.1017-1019.

The distribution of zooplankton as indicated by acoustic backscatter was compared with that of the phytoplankton biomass, with the degree of the shading caused by the presence of the bloom, with the density structure of the top 250 m of the water column and the current flow in the Bellingshausen Sea in the austral spring, 1992. High concentrations of phytoplankton were observed in an area between 67-68.5°S and 84-88°W. The relative importance of these parameters to the distribution of the zooplankton was observed to vary at different depths between 0 and 300 m. Near the surface and below the pycnocline the light field and the phytoplankton concentrations were more important, but in the intermediate region of the greatest vertical density differences $\sigma0$ was the most important parameter. The spatial spectra of the zooplankton abundance at different depths in the water column were compared. (Auth.)

Whitehouse, M.J., Priddle, J., Woodward, E.M.S., **Spatial variability of inorganic nutrients in the marginal ice zone of the Bellingshausen Sea during the Austral spring,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1047-1058, Refs. p.1057-1058.

Data on nutrients (nitrate, nitrite, ammonium, phosphate, silicate), biogenic-silica and chlorophyll *a* concentrations were collected along a south-to-north transect through the marginal ice zone of the Bellingshausen Sea during the austral spring of 1992. There was a marked gradient in near surface (≤100 m) concentrations from the most southerly occupied station to the northernmost. Nitrate, phosphate and silicate concentrations decreased along the transect from 33 to 21, 2.2 to 1.2 and 76 to 35 mmol/m^3, respectively. Nitrite, ammonium and biogenic-silica levels increased from 0.04 to 0.16, 0.01 to 2.5 and 0.2 to 4 mmol/m^3, respectively from south to north. Chlorophyll *a* concentrations increased from 0.1 at the most southerly station to >4.0 mg/m^3 in the north. A simple ice-melt model suggests that only a portion of the previous winter's sea-ice had melted in the study area. The impact of this ice-melt on nutrient concentrations was trivial. Predicted time scales of nutrient removal by phytoplankton growth varied for the three nutrients. (Auth. mod.)

Turner, S.M., Nightingale, P.D., Broadgate, W., Liss, P.S., **Distribution of dimethyl suphide and dimethylsulphoniopropionate in antarctic waters and sea ice,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1059-1080, Refs. p.1079-1080.

Dimethyl sulphide (DMS) and particulate and dissolved fractions of dimethylsulphoniopropionate (DMSPp and DMSPd) were measured on two simultaneous cruises through the Drake Passage to the Bellingshausen Sea during Oct. to Dec. 1992. Overall, average surface water concentrations for DMS and DMSPp were 2 nM (0.15-27 nM) and 25.6 nM (2-69 nM), respectively. Higher concentrations were observed in a phytoplankton bloom forming a band between 67.2° and 68.2°S, associated with the

Southern Polar Front. Concentrations of DMS + DMSP in ice were very high (up to 546 nM) but in the underlying water were 20 to 500 times lower. Comparison of sulphur data, pigments and phytoplankton species counts showed correlation of DMSPp with 19'-hexanoyloxyfucoxanthin (Hex) and *Phaeocystis* sp. A seasonal cycle for DMS in antarctic surface waters, based on all available literature data, is discussed in terms of the probable antarctic ocean contribution to the global ocean DMS flux. (Auth.)

Robertson, J.E., Watson, A.J., **Summer-time sink for atmospheric carbon dioxide in the southern ocean between 88°W and 80°E,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1081-1091, 27 refs.

Measurements of surface water dissolved carbon dioxide are presented from two cruises in the southern ocean, from Bellingshausen Sea to Princess Elizabeth Trough, with a number of observations close to the ice edge. The data, collected from early to late austral summer 1992-93, indicate that the ocean in these regions was acting as a sink for atmospheric carbon dioxide at this time. No correlation between carbon dioxide levels and the standing stock of phytoplankton or sea-surface temperature was observed, except in isolated regions of high chlorophyll concentration and across small source regions associated with fronts, respectively. Assuming that the observations can be generalized to the region encircled by the cruise tracks, the authors calculate CO_2 uptake for this region during the four months that the cruises took place. The observation of a sink is consistent with the most recent estimates of the regional budgets derived from atmospheric isotope data. Most data sets from earlier years show the region as neutral with respect to atmospheric CO_2, so it appears possible that the widespread sink observed, at the very least between 88°W and 80°E, is a recent phenomenon not present in some previous surveys. (Auth. mod.)

J-53849

Bellerby, R.G.J., Turner, D.R., Robertson, J.E., **Surface pH and $p\mathrm{CO}_2$ distributions in the Bellingshausen Sea, southern ocean, during the early Austral summer,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1093-1107, Refs. p.1105-1107.

Measurements of the carbon dioxide system (pH, $p\mathrm{CO}_2$) from the Bellingshausen Sea are discussed in relation to varying biological activity and hydrography. The pH was determined using on-line indicator spectrophotometry and varied between 7.65 and 7.85 (at 25°C) and between 8.04 and 8.25 at *in situ* temperatures. Except for the Bransfield Strait, $p\mathrm{CO}_2$ was below atmospheric $p\mathrm{CO}_2$ for the duration of the cruise, with the average level being 295±32 µatm (1 SE). Large mesoscale variability with no single control on the surface seawater carbon dioxide system was observed, although the majority of the study area was predominantly influenced by the hydrography of the circumpolar waters. The most significant exception was a region with high chlorophyll concentration south of the Southern Polar Front. (Auth.)

J-53850

Kennedy, H., Robertson, J.E., **Variations in the isotopic composition of particulate organic carbon in surface waters along an 88°W transect from 67°S to 54°S,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1109-1122, Refs. p.1121-1122.

The concentration and isotopic composition of carbon were measured in suspended particulate organic matter in surface waters of the South Pacific Ocean during the austral summer. Concurrent measurements of total dissolved inorganic carbon (ΣCO_2), pCO_2, particulate organic carbon (POC), salinity, chlorophyll and temperature provide an opportunity to study the covariance of these parameters with changes in the isotopic composition of particulate organic carbon (δ^{13}C-POC). The south-north transect did not show any significant changes in POC (10-19 mmol/m^3) or chlorophyll (0.5-1 mg/m^3), while δ^{13}C-POC variations of approximately 4 per mill were recorded. Although surface water CO_2(aq) is substantially out of equilibrium with the local atmosphere, the isotopic changes are negatively correlated with the concentration of dissolved carbon dioxide along the transect, and follow the general trends predicted from previously determined relationships. Cripps, G.C., **Biogenic hydrocarbons in the particulate material of the water column of the Bellingshausen Sea, Antarctica, in the region of the marginal ice zone,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1123-1135, 16 refs.

The biogenic hydrocarbon content of particulate matter of the Bellingshausen Sea in the region of the marginal ice zone (MIZ) has been investigated. Particulates were sampled from four depths to 200 m in pack ice and at the ice edge, and from seven depths to 3000 m in open ocean. Total *n*-alkane concentrations associated with particulates increased from 200 ng/l under the pack ice to 1000 ng/l in the open ocean, and decreased with depth in open water to 15 ng/l at 3000 m. The influence of phytoplankton on particulate material was shown to be negligible under the ice but extended horizontally and vertically as the ice edge retreated. Sea-ice algae did not appear to seed the phytoplankton growth under the ice or the subsequent "bloom" at the MIZ. The alkane signature of phytoplankton from the MIZ bloom was detected at a depth of 200 m near the ice edge, at 500 m in open sea, and in surface sediments (4100 m). It was concluded that the majority of particulate material in the water column was algal in origin. (Auth. mod.)

Robins, D.B., et al, **Relationship between suspended particulate material, phytoplankton and zooplankton during the retreat of the marginal ice zone in the Bellingshausen Sea,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1137-1158, Refs. p.1156-1158.

The distribution, abundance and composition of suspended particulates, phytoplankton and zooplankton biomass were investigated for the marginal ice zone in the Bellingshausen Sea during the austral spring of 1992. Marked changes were observed between the amount and composition of particulates under the sea-ice and those in open waters. Measures of phytoplankton abundance (chlorophyll) ranged from ca. 0.05 µg/l under the ice to 3 µg/l in the open waters to the north. The high nutrient concentrations and low level of phytoplankton under the ice suggest that this region is typical of over-wintering conditions and provides a suitable background comparison to the development of more productive, recently ice-free waters, further north. The biochemistry of particulates (lipid in particular), a more sensitive measure of environmental growth conditions, showed the area as a whole to be broadly split into two: under ice (light limited) and open water (no light limitation). Total particulate carbon was almost entirely composed of inorganic carbon under the ice; waters away from the ice edge also contained significant levels of inorganic carbon. (Auth. mod.)

Bury, S.J., Owens, N.J.P., Preston, T., **^{13}C and ^{15}N uptake by phytoplankton in the marginal ice zone of the Bellingshausen Sea,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1225-1252, Refs. p.1248-1252.

A two-ship cruise to the Bellingshausen Sea marginal ice zone (MIZ) in the austral spring-summer 1992 enabled a detailed study of the phytoplankton dynamics during the retreat of the ice sheet. Stations were set up along a transect from within the ice sheet at 70°S, 85°W to the open ocean 67°S, 85°W, and the rates of primary production and nitrogen uptake were determined in the ice and water column using *in situ* ^{13}C and ^{15}N incubation techniques. Nitrogen uptake was subdivided into components of nitrate, ammonium and urea uptake, and fractionated into <20 µm and >20 µm size classes. The ice station water column had a very low biomass, with values integrated to 30 m of 3 mg chl/m^2 and 25 mmol PON/m^2, high nutrient concentrations, and integrated carbon and nitrogen uptake values of 24 mg C/m^2/day and 12 mg N/m^2/day. Nutrient concentrations decreased and biomass and productivity in the water column increased towards the northernmost open water station. (Auth. mod.)

J-53857

Waldron, H.N., Attwood, C.G., Probyn, T.A., Lucas, M.I., **Nitrogen dynamics in the Bellingshausen Sea during the Austral spring of 1992,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1253-1276, Refs. p.1274-1276.

A series of ^{15}N experiments were conducted in the early summer of 1992 during the course of cruise 198 of R.R.S. *Discovery,* with a focus on the seasonal ice zone (SIZ) of the Bellingshausen Sea. Nitrogen (NO_3, NH_4 and urea) uptake was measured over the nominal euphotic zone, and size fractionation experiments of a similar nature were conducted on surface waters. The most productive zone during this study was not associated with stable ice-melt water but with a west-east oriented, haline dominated density front centered around 67.3°S. The pelagic bloom coincident with the area south of the front had a banded structure with chlorophyll *a* concentrations up to 5 mg/m^3. Integrated N uptake rates within the bloom varied between 56 and 34 mmol N/m^2/day, with a decreasing trend from north to south. A similar trend was evident in the *f*-ratios, where values decreased from 0.6 to 0.3. From size fractionated experiments in the bloom it was found that 82-87% of the chlorophyll *a* was in the netplankton fraction, which also accounted for 28 to 95% of the N uptake. The bloom was dominated by *Porosira glacialis, Coscinodiscus bouvet, Thallassiosira antarctica* and *Phaeocystis* spp. (Auth. mod.)

Shimmield, G.B., Ritchie, G.D., Fileman, T.W., **Impact of marginal ice zone processes on the distribution of ^{210}Pb, ^{210}Po and ^{234}Th and implications for new production in the Bellingshausen Sea, Antarctica,** *Deep-sea research. Part II,* July-Sep. 1995, 42(4-5), Topical studies in oceanography. Southern ocean JGOFS: the U.K. "STERNA" study in the Bellingshausen Sea, edited by D.R. Turner, N.J.P. Owens and J. Priddle, p.1313-1335, Refs. p.1334-1335.

The vertical distributions of ^{210}Pb, ^{210}Po and ^{234}Th in both dissolved and particulate phases of seawater were measured at five stations along the 85°W meridian in the Bellingshausen Sea. Sea-ice conditions during the expedition ranged from fully ice-covered (fast ice) to open water away from the marginal ice zone. Concurrent primary productivity and algal chlorophyll measurements revealed a band of high productivity at approximately 67°30'S, which remained in a rather static location during ice meltback. Along the transect a progressive increase in removal ("scavenging") and sinking of ^{210}Pb, ^{210}Po and ^{234}Th occurred towards the north (open water conditions). Application of a simple, irreversible scavenging model, and particulate organic carbon and organic nitrogen to radionuclide ratios measured on suspended particulate matter, allows the calculation of export production for this region. Gleitz, M., Van der Loeff, M.M.R., Thomas, D.N., Dieckmann, G.S., Millero, F.J., **Comparison of summer and winter inorganic carbon, oxygen and nutrient concentrations in antarctic sea ice brine,** *Marine chemistry,* Oct. 1995, 51(2), p.81-91, 49 refs.

During summer (Jan. 1991) and winter (Apr. 1992) cruises to the southern Weddell Sea, brine samples were collected from first year sea ice and analyzed for salinity, temperature, dissolved oxygen and major nutrient concentrations. Additionally, the carbonate system was determined from measurements of pH and total alkalinity. During winter, brine chemical composition was largely determined by seawater concentration in the course of freezing. Brine temperatures ranged from -1.9 to -6.7°C. Removal of carbon from the total inorganic carbon pool was related to reduced nutrient concentrations, indicating the presence of photosynthetically active ice algal assemblages in the winter sea ice. However, nutrient and inorganic carbon concentrations did not generally reach growth limiting levels for phytoplankton. The concurrent depletion of major nutrients generally corresponded to uptake ratios predicted from phytoplankton biochemical composition. Primary productivity in summer sea ice is apparently sustained until inorganic resources are fully exhausted, resulting in brine chemical compositions that differ profoundly from those of surface waters. This may have important implications for pathways of ice algal carbon acquisition, carbon isotope fractionation, and for species distribution in the open water phytoplankton. (Auth. mod.)

Catalano, G., Benedetti, F., **Distribution of nutrients in the Terra Nova Bay and in the Ross Sea,** Italy, National Scientific Commission for Antarctica. Oceanographic Campaign 1987-88: Data report, Part I, physical, chemical and biological oceanography, Genoa, 1990, p.61-83, 11 refs.

The main objective of the expedition of 1987-88 was to characterize chemically, through the analysis of several parameters, the basin of Terra Nova Bay and to study the spatio-temporal variations of these parameters. The parameters chosen as main targets were: dissolved oxygen (O_2) and nutrients (NO_3, NO_2, NH_3, PO_4, SiO_4). A preliminary analysis of some major constituents was also carried out: fluorides (F), sulphates (SO_4), calcium (Ca), magnesium (Mg), sodium (Na), potassium (K), lithium (Li) and strontium (Sr). The zone of operation corresponded to a grid of 40 stations, covering the whole of Terra Nova Bay and a small part of the Ross Sea. Tabulated results are presented.

Massé, L., Faugères, J.C., Bernat, M., Pujos, A., Mézerais, M.L., **600,000-year record of Antarctic Bottom Water activity inferred from sediment textures and structures in a sediment core from the Southern Brazil Basin,** *Paleoceanography,* Dec. 1994, 9(6), p.1017-1026, 53 refs.

At the northern exit of the Vema Channel in the Southern Brazil Basin, deep currents linked with Antarctic Bottom Water flow (AABW, below 4200 m) have formed contouritic accumulations along the continental rise. Lithologic and textural investigations were carried out on a Kullenberg core in order to establish a chronology of late Pleistocene-Holocene fluctuations in AABW flow. The core, spanning the last 600,000 years, was recovered from a field of sediment waves. The deposits consist of fine grained muds. Two main types of facies can be identified: (1) yellowish brown muds, with frequent manganese enrichments forming dark laminae, and (2) homogeneous gray-green muds. Two indicators of paleocurrent activity have been considered: (1) erosional sediment features that give evidence for high amplitude and short-term current events, and (2) grain-size fluctuations (percentage of particles greater than 10 μm), indicating low amplitude and long-term variations. Two periods can be defined. The first one (ca. 600 to ca. 350 kyr B.P.) is characterized by an instability in current activity, with strong flow events recorded as erosional surfaces. The second period (350 kyr B.P. to present) is marked by globally weaker current activity and long-term fluctuations of lower amplitude and longer duration. (Auth. mod.)

Roese, M., Speroni, J., **Dynamics of Bahía Paraíso waters and its link with Gerlache Strait** [Dinámica de las aguas en bahía Paraíso y su vinculación con el estrecho de Gerlache, Antártida], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1995, No.416, p.1-29, In Spanish with English summary. 27 refs.

During the summer of 1990-91, the authors studied the circulation in Paraíso Bay and Gerlache Strait using observations of iceberg drift, temperature, current and tidal measurements. Paraíso Bay has a peculiar climatology, where 66.6% of the time winds are calm, and have a mean duration of 17.5 hours. Coastal and bottom topography irregularities strongly condition the tidal currents, producing important countercurrents. The Eulerian and Lagrangian information collected for the flood tide depicts a counterclockwise circulation around Bryde I., while for the ebb tide the accumulated waters in Paraíso Bay drain through all of its entrances. The authors conclude that there is a current to the SE in the Bismarck Strait, originating in the Bellingshausen Sea. From the vertical temperature distribution in Gerlache Strait, they infer the existence of two mean subsurface currents which converge at Paraíso Bay: one in a NE direction, the other, with denser water, flows SW in the intermediate and deep layers of the Gerlache Strait. Arístegui, J., Montero, M.F., **Plankton community respiration in Bransfield Strait (antarctic ocean) during austral spring,** *Journal of plankton research,* Aug. 1995, 17(8), p.1647-1659, Refs. p.1658-1659.

Community respiration (R) was determined in Bransfield Strait from oxygen changes in water samples incubated in borosilicate bottles maintained at *in situ* temperature. The respiratory electron transport system (ETS) activity of seawater communities was also measured from the same samples. The results do not differ significantly from other published results for the arctic and antarctic oceans. Assuming a respiratory quotient of unity, the areal respiration ranges between 0.45 and 1.69 g C/m^2/day (mean=0.8) would represent an important sink for the primary production reported for Bransfield Strait. The spatial distribution of community respiration showed higher values associated with the warmer and phytoplankton-rich waters outflowing from Gerlache Strait into Bransfield Strait, and with the front that separates Bellingshausen Sea waters from Weddell Sea waters. It is suggested that this pattern of distribution may be related to the transport of organic matter by the Bransfield Current along the front. (Auth. mod.)

Zatsepin, A.G., Emel'ianov, M.V., **Regularities of intrusion water stratification in the south polar frontal zone of the Atlantic Ocean,** *Russian meteorology and hydrology,* 1995, No.1, p.25-30, Translated from Meteorologiia i gidrologiia. 9 refs.

Characteristic depths of ocean current intrusions and related temperature anomalies are determined from analysis of fine-structured heterogeneities of intrusion origin in vertical profiles of temperature in the south polar frontal zone. For each of the identified intrusions a transfrontal adiabatic scale considered as a horizontal intrusion scale is estimated. Correlation is obtained between this scale and a local baroclinic radius of intrusion. According to Woods' conception (1974) and Kuzmina and Rodionov's mathematical model (1992), this correlation is evidence of eddy dynamics of intrusions. Based on the interaction between eddies and intrusions, the coefficient of transfrontal exchange of heat and passive tracer is parameterized and evaluated. (Auth. mod.)

Snaith, H.M., **Scales of variability in the southern ocean from satellite altimetry and FRAM (Fine Resolution Antarctic Model),** *SPIE—The International Society for Optical Engineering,* 1994, Vol.2319, Oceanic remote sensing and sea ice monitoring, Rome, Italy, Sep. 26, 1994. Edited by J.A. Johannessen and T.H. Guymer, p.19-30, 15 refs.

Satellite altimetry and numerical models offer two methods of studying the circulation of the remote southern ocean at a range of space and time scales. Repeated tracks of satellite altimeter data from GEOSAT and ERS-1 have been used to determine characteristic length scales of oceanic mesoscale features, and the time scales of this activity, in the Agulhas Region. The results are shown and discussed in terms of the local ocean dynamics and the differences in sampling between the two satellites. The Fine Resolution Antarctic Model is a numerical model of the southern ocean, designed to resolve mesoscale features of the circulation. A six year time series of monthly model surface dynamic heights has been sampled as if by an altimeter. These "model altimeter" data have been processed using the same methods as for real altimeter data. The spatial scales of mesoscale activity in the model were determined using the same techniques as for the real altimeter data and the results compared in order to determine the ability of the model to recreate the mesoscale activity of the regions studied. Rycroft, M.J., **Antarctica—where space meets Planet Earth,** Antarctic science: global concerns. Edited by G. Hempel, Berlin, Springer Verlag, 1994, p.31-44, 48 refs.

DLC G845.5.A54 1994

This paper gives some examples of topical problems relating to antarctic research where measurements made from satellites are complemented by observations made from the Earth's surface. The field has been restricted to studies of the atmosphere and near-Earth space environment, concentrating upon the ozone hole and solar-terrestrial physics. The several unique aspects of Antarctica for such research should be further capitalized upon in future studies.

Xu, W.Y., **Comparative study on the ionospheric current systems in the Antarctic and Arctic regions,** *Antarctic research,* June 1994, 5(1), p.1-10, 11 refs. For Chinese original see 22K-51009.

The current systems representing the solar and lunar daily variations (S and L) of the geomagnetic field have been calculated on the basis of data obtained from the global network of geomagnetic observatories. The characteristics of these current systems in the antarctic and arctic regions have been analyzed comparatively. The results show the following: there are certain differences in the current systems of these two regions, which implies definite differences in the ionospheric dynamic processes responsible for both S and L and the field-aligned current responsible for S; there are notable differences in the internal current systems of the two polar regions, which is attributed to both the inducing field (current) and underground conductivity. In general, the conductivity of the antarctic region is higher that of the arctic region. (Auth.)

Yang, S.F., Xiao, F.H., **Characteristics of Pc3 pulsations at Great Wall Station of Antarctica,** *Antarctic research (Chinese edition),* June 1994, 6(2), p.62-67, In Chinese with English summary. 5 refs.

In this paper Pc3 pulsations at the Great Wall Station are analyzed statistically from Aug. 16 to Nov. 20, 1990. Their occurrence frequency, frequency distribution and polarization were studied. The mechanism of excitation and propagation for Pc3 pulsations at Great Wall is investigated theoretically. (Auth.)

Mielke, T.A., **Aspects of the magnetospheric amplification phenomenon in ducted whistler-mode waves,** Stanford University, 1993, 78p., University Microfilms order No.AAD94-14621, Ph.D. thesis. Refs. p.76-78.

Interactions between ducted whistler-mode waves and energetic particles in the magnetosphere often lead to strong wave amplification, characteristically associated with such nonlinear effects as the appearance of sidebands and triggering of free-running emissions. Experiments at Siple Station were conducted to study the growth process. Data from the experiment on antenna polarization effects on coupling of wave energy into the whistler-mode agree well with theory. Results of experiments aimed at determining the wave-particle interaction underlying the observed wave growth were consistent with a gyro-resonance interaction but not with a Landau resonance interaction. Experiments using pulses with parabolic rather than linear frequency chirps also produced wave growth, providing the capability to test theories of the effects of spatial variations on the wave growth process. A further observed phenomenon, that of a wave power threshold below which the growth and emissions effect does not occur, was also investigated. (Auth.)

Zhen, W.M., Cao, C., Wu, J., **Analysis of the ionospheric anomaly over Great Wall Station, Antarctica,** *Antarctic research (Chinese edition),* Sep. 1994, 6(3), p.33-37, In Chinese with English summary. 6 refs.

The authors use an empirical method to derive the height of maximum electron concentration of the F_2 region and neutral meridional winds over Great Wall Station. With the HWM-90 Model, prediction of meridional winds are also calculated. Results explain two anomaly features of ionosonde data: in summer, peak values of f_0F_2 appear during night time; in winter, especially during June and July, f_0F_2 decrease dramatically compared to the summer data. The summer anomaly can be explained by combining effects of two competing causes, thermospheric winds and solar effects on the ionosphere. The high geographic latitude and middle geomagnetic latitude of Great Wall Station are important factors. (Auth.)

Xu, D.G., Kivelson, M.G., **Polar cap field-aligned currents for southward interplanetary magnetic fields,** *Journal of geophysical research,* Apr. 1, 1994, 99(A4), p.6067-6078, Refs. p.6076-6078.

It has been common to suppose that polar region field-aligned currents for southward interplanetary magnetic fields (IMF) consist of two parts: region 1 and region 2 currents. It is often suggested that both of these current systems flow on closed field lines. In this pilot study the limited data available from the ISIS 2 satellite are used to examine region 1 currents with the objective of establishing whether or not they can exist partially on open field lines (i.e., inside the polar caps) for southward IMF. Magnetic field perturbations were used to identify the field-aligned currents (FACs). It is suggested that in the presence of southward IMF, region 1 currents can be composed of two parts, one flowing on closed field lines and one flowing on open field lines. Because the portion of the region 1 currents inside the polar caps may be generated by different processes from the portion on closed field lines, the authors refer to the region 1 currents on open field lines as R1O currents. The region 1 currents on closed field lines may be called R1C currents. Data from both polar regions are included. (Auth. mod.)

Rodger, A.S., et al, **New mechanism for polar patch formation,** *Journal of geophysical research,* Apr. 1, 1994, 99(A4), p.6425-6436, Refs. p.6435-6436.

Polar patches are regions within the polar cap where the F-region electron concentration and airglow emission at 630 nm are enhanced above a background level. Previous observations have demonstrated that polar patches can be readily identified in Polar Anglo-American Conjugate Experiment (PACE) data. Here, PACE data from Halley Station and those from complementary instruments from two other antarctic stations are used to show that some polar patches form in the dayside cusp within a few minutes of the simultaneous occurrence of a flow channel event (short-lived plasma jets of ca. 2 km/s) and azimuthal flow changes in the ionospheric convection pattern. The latter are caused by variations of the y-component of the interplanetary magnetic field. The physical processes by which these phenomena cause plasma enhancements and depletions in the vicinity of the dayside cusp and cleft are discussed. Subsequently, these features are transported into the polar cap where they continue to evolve. (Auth. mod.)

Nishitani, N., Hough, G., Scourfield, M.W.J., **Spatial and temporal characteristics of giant undulations,** *Geophysical research letters,* Dec. 1, 1994, 21(24), p.2673-2676, 7 refs.

A giant undulation event observed at SANAE Station is reported. During the event the geomagnetic activity was high, as was the case in previously reported observations of giant undulations. Data were recorded by all-sky and small field-of-view TV cameras, from 2346 UT on Sep. 10 to 0007 UT on Sep. 11 (MLT about 2200 h), 1987. The fine temporal and spatial resolution of the TV data made a detailed study of the undulation possible. The average wavelength was 170 km and the amplitude of the wave increased from 70 km to 140 km in 10 minutes. Wave propagation, measured at different positions on the undulation, was duskward with a phase speed of 540 to 650 m/s. An inner structure, propagating at a speed of 2.5 to 4.0 km/s, about 3 times as fast as the undulation form, was observed just poleward of the undulation boundary, indicating the presence of strong velocity shear. The linear theory of the velocity shear instability is examined as a possible generation mechanism on the basis of these observations. (Auth.)

Ramadurai, S., **Very long time variations of cosmic ray intensity and their origin,** *Advances in space research,* Jan. 1995, 15(1), Galactic cosmic ray heavy ions. Proceedings of the Topical Meeting of the COSPAR Interdisciplinary Scientific Commission E (Meeting E7) of the COSPAR Twenty-Ninth Plenary Meeting, Washington, D.C., Aug. 28-Sep. 5, 1992. Edited by S. Biswas and S. Ramadurai, p.(1)41-(1)48, 22 refs.

A large number of sources contribute to cosmic rays in the Galaxy. By studying time profiles of cosmic ray intensity over a very long time, it is hoped to get some information about a possible source. In this respect, long-lived radioisotopes like ^{10}Be and ^{14}C, produced by cosmic ray interactions in the Earth's atmosphere, carry information on the long-term variations in the local cosmic ray intensity. The record of ^{10}Be concentrations in the Vostok ice core in Antarctica over the past 100 Kyr displays several steep and relatively brief increases. An increase at about 35 Kyr is attributed to increase in cosmic ray intensity arriving at the Earth. This increase is interpreted as due to the arrival of the shock-front from the recently discovered gamma ray and X-ray pulsar, Geminga. Thus a direct connection between a non-solar cosmic ray source and the resultant increase in the cosmic ray intensity at the Earth is established for the first time. It is suggested that the ^{26}Al intensity in the local interstellar bubble should be doubled as a result of this source. (Auth.)

Jones, D.L., **Direct imaging of planetary systems with a ground-based radiotelescope array,** *Astrophysics and space science,* 1994, 212(1-2), Planetary Systems: Formation, Evolution, and Detection, Pasadena, CA, Dec. 1992, Proceedings. Edited by B.F. Burke, J.H. Rahe, and E.E. Roettger, p.391-394, 9 refs.

The National Radio Astronomy Observatory's proposed Millimeter Array (MMA) will bring unprecedented sensitivity, angular resolution, and image dynamic range to the millimeter wavelength region of the spectrum. An obvious question is whether such an instrument could be used to detect planets orbiting nearby stars. The techniques of aperture synthesis imaging developed for centimeter wavelength radio arrays are capable of producing images whose dynamic ranges greatly exceed the brightness ratio of a solar-type star and a Jupiter-like planet at submillimeter or millimeter wavelengths. The angular resolution required to separate a star and planet at a few pc distance can be obtained with baselines of several km. The greatest challenge is sensitivity. At the highest possible observing frequencies, about 300 GHz for typical high, dry sites, and about 900 GHz from the antarctic plateau, the proposed MMA will be able to detect the thermal emission from a Jupiter-like planet a few pc distant. An upgraded MMA operating near 300 GHz with twice the currently proposed number of antennas, a 20% fractional bandwidth, and improved receivers could detect Jupiter at 4 pc in a few months. Building such an array on the antarctic plateau and operating at ca. 900 GHz would allow a Jupiter at 4 pc to be detected in approximately one day of observing time.

Klain, B.I., Kurazhkovskaia, N.A., Dobnia, B.V., **Relationship between the theta aurora and ULF emissions at high latitudes,** *Polar geography and geology,* Apr.-June 1994, 18(2), p.168-174, Translated from Antarktika, No.32, 1993. 12 refs.

Variations in the electromagnetic emission accompanying the appearance of theta aurora in the magnetosphere polar regions were studied. It is shown that modulated LF emissions appear within the range of 0.02-2.35 Hz, where the characteristic modulation period is ≈30 min during a theta aurora at the latitude of the dayside cusp. These emissions precede the development of the transpolar arc in the night area of the polar cap by 15-30 min. The revealed effect may be explained by the development of a reconnection process in the cusp region when $B_z>0$, and subsequent reconfiguration of the magnetospheric tail. (Auth. mod.)

Cazeneuve, H., **Absorption and geomagnetic processes in the polar ionosphere** [Procesos geomagnéticos y de absorción en la ionosfera polar], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1994, No.404, 33p., In Spanish with English summary. 11 refs.

Results from simultaneous observations of ionospheric absorption and geomagnetic disturbances, obtained at Belgrano and San Martin stations, are presented. The location of these stations is adequate for this study, since they are under different regimes of magnetospheric activity. Common and deviant features are revealed by cross-correlation techniques and spectral analysis. Dynamical spectra, computed by sliding the analysis interval every 15 min, provided a good spectral characterization of geomagnetic and absorption events. Three distinct spectral bands were found, which reveal a different level of absorbed or released power over discrete frequency intervals. The observation of cyclical variations of the spectral parameters is another significant result. Differences in the annual and seasonal variations found at both stations are explained in terms of the drift of convection electric fields, which accelerate substorm electrons. (Auth. mod.)

Crickmore, R.I., **Mean thermospheric winds observed from Halley, Antarctica,** *Annales geophysicae,* Nov. 1994, 12(10/11), p.1101-1113, 24 refs.

Thermospheric winds on a total of 237 nights have been studied for the effects due to geomagnetic activity, solar flux, and season. The observations were made from 1988 to 1992 by a Fabry-Perot interferometer (FPI) operating at Halley Station. This is the first statistical study of thermospheric winds near the southern auroral zone. The main factor affecting the wind velocities is the geomagnetic activity. Increases in activity cause an increase in the maximum equatorward wind, and cause the zonal wind in the evening to become more westerly. Smaller changes in the mean wind occur with variations in season and solar flux. Comparisons with predictions of the Vector Spherical Harmonic Model (VSH) show that for low geomagnetic activity the predicted phases of the two components of the wind closely resemble the observations but the modelled amplitudes are too small by a factor of two. At high geomagnetic activity the major differences are that modelled zonal velocity is too westerly in the evening and too easterly after 04 UT. The modelled ion densities at the F-region peak are a factor of up to 9 too large, whilst the predicted mean value and diurnal variation of the altitude of the peak are significantly lower than those observed. It is suggested that these differences result from the ion loss rate being too low, and an inaccurate model of the magnetic field. (Auth. mod.)

K-52033

Balmforth, H.F., Clilverd, M.A., Smith, A.J., **Case study of storm commencement and recovery plasmaspheric electric fields near *L*=2.5 at equinox,** *Annales geophysicae,* Aug. 1994, 12(7), p.625-635, 16 refs.

Data from the VLF Doppler experiment at Faraday Station are used to study the penetration of the high-latitude convection electric field to lower latitudes during severely disturbed conditions. Alterations of the electric field at *L*-values within the range 2.0-2.7 are studied for two cases at equinox (Sep. 10-12 and May 1-3, 1986). The recovery of the electric field is found to be approximately an exponential function of time. Values for the equatorial meridional $E \times B$ drift velocity, inferred from the data, are used as inputs to a model of the plasmasphere and ionosphere. The model and experimental results are used to investigate the post-storm alteration of ionospheric coupling processes. The magnitude of the effect of ionosphere-plasmasphere coupling fluxes on N_mF2 values and the O^+-H^+ transition height is dependent on the local time of storm commencement, and on the orientation of the electric field. The coupling fluxes appear to have a maximum influence on ionospheric content during the main phase of geomagnetic activity that produces outward motion of plasmaspheric whistler data. (Auth. mod.)

Rodger, A.S., Pinnock, M., Dudeney, J.R., Waterman, J., De la Beaujardiere, O., Baker, K.B., **Simultaneous two hemisphere observations of the presence of polar patches in the nightside ionosphere,** *Annales geophysicae,* Aug. 1994, 12(7), p.642-648, 26 refs.

The presence of polar patches as observed simultaneously in the same magnetic meridian of opposite nightside ionospheres by coherent and incoherent scatter radars are described. The patches appear to be related to variations either in the B_z or B_y component of the interplanetary magnetic field which cause transient merging on the dayside magnetopause. The passage and characteristics of polar patches as they traverse the polar cap into the nightside auroral oval are not significantly affected by the occurrence of small substorms. This study illustrates how the observations of polar patches in the nightside high-latitude ionosphere could be of great value in determining their formation process. (Auth.)

Kikuchi, T., Yamagishi, H., **Drift of auroral absorption observed with a scanning beam riometer at Syowa Station,** *Journal of the Communications Research Laboratory,* Mar. 1990, 37(150), p. 1-14, 16 refs.

The scanning beam riometer at Showa Station detects north-south (N-S) and east-west (E-W) movement of auroral absorptions with a time resolution of 10 sec and spatial resolution of 10 km at the ionospheric height. It is shown that auroral absorptions drift eastward in the post-midnight to pre-noon sectors, and drift westward in the noon to pre-midnight sectors, with speeds ranging from 60 to 700 m/s. The E-W drift direction is reversed around the 10 MLT sector where the drift direction is poleward. The E-W drift direction is also reversed in the pre-midnight sector where the drift is equatorward. This local time dependence of the absorption drift coincides with the ionospheric projection of the magnetospheric convection deduced from IS radar and balloon observations. The fact that the eastward (westward) drift corresponds to the negative (positive) geomagnetic H deflection with respect to the quiettime level strongly suggests that the magnetospheric source region for the energetic electron precipitation drifts due to the E x B drift. It is inferred that the auroral absorption is spatially elongated in the form of a belt. The width of a typical absorption belt ranges from 30 to 60 km. The observed belt-shaped auroral absorption suggests the existence of a sheet-like structure of magnetospheric plasma, where the pitch angle diffusion causes the precipitation of energetic electrons responsible for the auroral absorption. (Auth.)

Yearby, K.H., Smith, A.J., **Polarisation of whistlers received on the ground near** ***L*****=4,** *Journal of atmospheric and terrestrial physics,* Sep. 1994, 56(11), p.1499-1512, Refs. p.1511-1512.

The observed polarization of the horizontal magnetic components of whistler mode signals received at Halley Station (L=4.3) is in many cases that expected from a simple model of the trans-ionospheric and sub-ionospheric propagation in the Southern Hemisphere, i.e. right-hand elliptical (field vectors rotate clockwise, looking towards the source) for ionospheric exit points close to the receiver, tending towards linear for more distant exit points. This suggests it may be possible to use the observed polarization to estimate the propagation distance. However, in other cases, in certain frequency ranges, left-hand elliptically polarized signals have been observed. More realistic models do predict polarization reversals at certain frequencies and exit point to receiver distances, but not over such a wide frequency range as has sometimes been observed. Also, in some cases, signals with nearly right-hand circular polarization have been observed for exit points at large distances where linear polarization would be expected. (Auth.)

Kato, K., Sato, N., Tonegawa, Y., **Estimation of geomagnetic conjugate points using Pc5 geomagnetic pulsation,** *Journal of geomagnetism and electricity,* 1994, 46(5), p.363-372, 22 refs.

Pc5 pulsation data were obtained simultaneously at three coordinated stations in Iceland and at three stations in Antarctica, including Showa Station, for the months of Mar. and May in 1988. In this analysis, it was assumed that Pc5 pulsations have a form of odd mode standing oscillations of the geomagnetic field line with linear phase shifts among the stations in the horizontal plane. Conjugate points were calculated uniquely. The statistical result showed that conjugate points of Showa Station estimated from the Pc5 events were concentrated around the conjugate points in Iceland calculated from the magnetic field model of Tsyganenko (1987) within the range of 66-68° in latitude, and 70-76° in longitude, i.e., less than 1/5 wavelength. (Auth.)

Singh, J., Nagabhushana, B.S., Babu, G.S.D, Uddin, W., **Study of calcium-K network evolution from Antarctica,** *Solar physics,* Aug. 1994, 153(1-2), p.157-167, 14 refs.

To study the evolution of large convective cells known as supergranules, a solar telescope was set up at Maitri Station in Antarctica during the local summer months (Dec. 1989 through Mar. 1990). A continuous sequence of calcium K-line filtergrams for 106 hours spaced at intervals of about 10 min was obtained. Analysis of the data indicates that the most probable lifetime of the calcium-K network is about 22 hours. The lifetime depends upon the size of the cell and is larger for bigger cells. The data also show that cells of a given size associated with remanent magnetic field regions live longer than those in the field-free region. This may mean that the magnetic field plays an important role in the confinement of these structures. (Auth.)

Smith, A.J., **VELOX: a new VLF/ELF receiver in Antarctica for the Global Geospace Science mission,** *Journal of atmospheric and terrestrial physics,* Apr. 1995, 57(5), p.507-524, 41 refs.

VELOX (VLF/ELF Logger Experiment), a new facility for systematically studying the characteristics of magnetospherically generated ELF/VLF radio noise received at a high-latitude ground station (Halley, Antarctica) measures continuously at 1 s resolution the absolute power (peak, mean, and minimum), arrival azimuth, and polarization ellipticity in 8 logarithmically spaced frequency bands ranging from 500 Hz to 9.3 kHz. All filtering etc. is done in real time using digital signal processing (DSP) techniques. Key parameters for each day are extracted and regularly transferred to the Global Geospace Study Central Data Handling Facility. Data from the first year of operation (1992) show that, whilst the upper channels (6 kHz and 9.3 kHz) are dominated by thunderstorm (sferic) noise, which is strongest at night and repeatable from day to day, magnetospheric chorus and hiss emissions are more important in the 1-4 kHz range of high attenuation in the Earth-ionosphere waveguide. Three classes of event are usually observed during specific local time sectors: substorm-related chorus events in the midnight-dawn sector, dawn chorus, and hiss-like events in the afternoon; all may occasionally be completely absent on quiet days. Candidi, M., Cerulli-Irelli, P., Rossi, L., **AGONET program,** Italian Research on Antarctic Atmosphere, Conference proceedings. Vol.45, Bologna, Italian Physical Society, 1994, p.351-361, 4 refs.

AGONET (Antarctic Geospace Observatory NETwork) is a network of antarctic observatories devoted to measurement of geospace parameters which are important in the field of ionosphere-magnetosphere coupling. The observatories will include those sites where appropriate instrumentation is already in operation, or is planned for installation. Other sites to uniformly cover an appropriate grid will be instrumented with automatic observatories which are already planned by several national programs (USA, UK, Japan). A detailed description of the program is presented. (Auth. mod.)

De Santis, A., Chiappini, M., **Chaos and fractal behaviour of the geomagnetic field over polar caps: some preliminary results,** Italian Research on Antarctic Atmosphere, Conference proceedings. Vol.45, Bologna, Italian Physical Society, 1994, p.363-369, 12 refs.

Geomagnetic field variations in Antarctica can be analyzed by means of fractal and chaotic techniques. Comparisons with corresponding recordings at a medium latitude observatory show distinct behavior either in the time domain or in phase-space. The time evolution of an antarctic substorm can be interpreted with deterministic chaos, having some analogies with Brownian motion statistics. (Auth.)

Ruzmaikin, A.A., Feynman, J., Goldstein, B.E., Smith, E.J., **Intermittent turbulence in solar wind from the south polar hole,** *Journal of geophysical research,* Mar. 1, 1995, 100(A3), p.3395-3403, 28 refs.

The magnetic fields measured by the Ulysses spacecraft were used to study solar wind turbulence in the fast solar wind from the south polar hole. The spacecraft was at about 46° south latitude and 3.9 AU. To permit a better comparison of the observations with the theoretical models, the structure characteristics of the data are analyzed. Exponents of the second-order structure functions (power spectra) and the higher-order normalized structure functions for the components of the magnetic fields can be approximately described by two basic numbers: the spectral exponent and the intermittency exponent. The intermittency exponent characterizes correlation properties of the energy cascade from large to small scales. The measured spectral indices are reduced according to a simple model for Alfvén turbulence and compared with second-order spectral theory. The reduced spectral indices for the period range of 1 min to about a half hour are remarkably constant and in good agreement with the value of 3/2. The tentative conclusion is that the high-frequency turbulence appears to agree with the model of random-phased Alfvén waves. (Auth. mod.)

Anderson, H.M., Engebretson, M.J., Arnoldy, R.L., Cahill, L.J., Jr., Newell, P.T., **Statistical study of hydromagnetic chorus events at very high latitudes,** *Journal of geophysical research,* Mar. 1, 1995, 100(A3), p.3681-3692, 26 refs.

Hydromagnetic (HM) chorus events are ULF waves with typical frequencies from 0.2 to 0.6 Hz; their frequency-time spectrum consists of a combination of band-limited unstructured emissions and discrete elements. These waves are one of a class of short-period ULF emissions (in the Pc 1 and 2 frequency range) that may be of value in ground-based identification of the footprint of magnetospheric boundary regions. As part of an extensive survey of Pc 1 and 2 waves at very high latitudes, the authors have identified all occurrences of HM chorus in nearly a full year's data from South Pole Station and McMurdo during 1990, and at McMurdo and Søndre Strømfjord, Greenland during 1988. In agreement with previous studies, these events tend to occur within a few hours of local noon. Study of particle boundary data indicated that the events reported here occurred during conditions of extremely contracted auroral ovals and are thus also consistent with an outer dayside magnetospheric source region. However, the occurrence of HM chorus events in this high-latitude data set was limited to the months of Oct. through May, with an occurrence peak in Feb., and no events were found in the months of July through Sep. in either of the years studied. This suggests not a seasonal variation (with late winter minimum) but rather an apparent annual variation. (Auth. mod.)

Conde, M., Dyson, P.L., **Thermospheric vertical winds above Mawson, Antarctica,** *Journal of atmospheric and terrestrial physics,* May 1995, 57(6), p.589-596, 18 refs.

High-resolution night-time Fabry-Perot spectra of the λ630 nm OI thermospheric airglow emission obtained from Mawson, Antarctica, during the austral winter of 1992 have been used to provide estimates of thermospheric temperature and neutral wind. In this paper, the authors report on characteristics of the resulting vertical wind estimates. The final data set comprised 103 observing nights between Mar. 18 and Sep. 20 for a total of 2096 useable zenith spectra. Because the instrumental reference rest wavelength of the λ630 nm emission is not known, this experiment was only capable of measuring vertical wind variations relative to an arbitrarily-chosen reference velocity. For this work, the authors established their reference by requiring that the nightly mean vertical wind be zero. They have divided the data into two subsets, corresponding to days of quiet and moderately disturbed magnetic activity. In both cases, the mean daily variation in vertical wind velocity was dominated by its diurnal component. (Auth. mod.)

Smith, R.W., Hernandez, G., **Vertical winds in the thermosphere within the polar cap,** *Journal of atmospheric and terrestrial physics,* May 1995, 57(6), p.611-620, 13 refs.

Vertical winds measured in the upper and lower thermosphere above Amundsen-Scott Station show a predominantly diurnal variation with an average amplitude of 40 m/s and 10 m/s, respectively. Downward motion was typical of the dayside polar cap in the vicinity of the cusp and cleft, and upward motion of about the same magnitude occurred in the midnight sector. Observations during the June 1991 storm period showed that the amplitude of diurnal variation was well correlated with the daily sum of K_p or σK_p, and also that the downward wind was the most sensitive to K_p change. Vertical winds in excess of 150 m/s were observed on the most active day. These measurements bear strong similarities to vertical wind data from Longyearbyen, Svalbard, at a similar geomagnetic latitude in the Northern Hemisphere. (Auth. mod.)

Crickmore, R.I., **Study of the thermospheric forces at a high latitude site on two days of differing geomagnetic activity,** *Journal of atmospheric and terrestrial physics,* June 1995, 57(7), p.759-773, 34 refs.

Data from a Fabry-Perot interferometer and Dynasonde at Halley Station have been used to calculate the forces acting on the high latitude thermosphere. Two case studies of the forces have been undertaken to study why the thermospheric zonal wind speeds are typically so different on nights with different geomagnetic activity. One case study analyses the forces on a geomagnetically active night and the other analyses them on a geomagnetically quiet night. Even on the geomagnetically active night, it is found that the ion drag force is not necessarily the largest force at any given time. Simple comparison of the magnitudes of the forces does not make it very clear which ones dominate in controlling the motion of the thermosphere. This can be seen more clearly by rewriting the momentum equation so that the neutral velocity is expressed in terms of the ion velocity, and the other forces normalized by the ion density. It then becomes clear that, in the evening, the differences in the neutral velocity are due to increases in both ion density and ion velocity, while in the morning, only changes in ion density are important. (Auth. mod.)

Bering, E.A., III, et al, **Balloon measurements above the South Pole: study of ionospheric transmission of ULF waves,** *Journal of geophysical research,* May 1, 1995, 100(A5), p.7807-7819, 47 refs.

The authors report an experimental study of the Hughes and Southwood model of the transmission of electromagnetic signals from the ionosphere/magnetosphere to the lower atmosphere. The electric field data were obtained from one of eight high-latitude balloon payloads launched above the pole during the South Pole Balloon Campaign in the 1985-86 austral summer. The magnetic field data are from the South Pole magnetometer. The balloon payloads were instrumented with double-probe electric field detectors and bremsstrahlung X ray detectors. One of the events from flight 7 had an amplitude in the range of 10-20 mV/m and a period of several minutes. In the magnetosphere, the wave was probably an Alfvén mode. The wave event was superimposed on background fluctuations that can be attributed to turbulence. The results agree with the predictions of the model in that the best coherence is observed between parallel components of E versus B. (Auth. mod.)

Gundersen, J.O., et al, **Degree-scale anisotropy in the cosmic microwave background: SP94 results,** *Astrophysical journal,* Apr. 20, 1995, 443(2, Part 2), p.L57-L60, 22 refs.

Results are presented from two observations of the cosmic microwave background (CMB) performed from the South Pole during the 1993-94 austral summer. Each observation employed a 3° peak-to-peak sinusoidal single-difference chop and consisted of a 20° x 1° strip on the sky. The first observation used a receiver which operated in three channels between 38 and 45 GHz (Q-band) with a FWHM beam which varies from 1° to 1.15°. The second observation overlapped the first and used a receiver which operates in four channels between 26 and 36 GHz (Ka-band) with a FWHM beam from 1.5° to 1.7°. Significant correlated structure is observed in all channels for each observation. The spectrum of the structure is consistent with a CMB spectrum and is formally inconsistent with diffuse synchrotron and free-free emission at the $5\ \sigma$ level. The amplitude of the structure is inconsistent with 20 K interstellar dust; however, the data do not discriminate against flat or inverted spectrum point sources. (Auth. mod.)

Cazeneuve, H., **Interplanetary sources of geomagnetic activity at high latitudes** [Fuentes interplanetarias de la actividad geomagnética en altas latitudes], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1994, No.432, 24p., In Spanish with English summary. 15 refs.

A study of a large body of geomagnetic data from 10 antarctic stations reveals the existence of clearly defined periods of activities which are closely linked to polarity reversals of the interplanetary magnetic field. These periods are reliable indicators of a penetration of substorm energy into the magnetosphere at each crossing of the heliospheric current sheet. The examination of the series of geomagnetic data permits one to identify three types of activity, according to their dependence on interplanetary events. (Auth. mod.)

Stening, R., Fleming, K., Fraser, G., **Upper atmosphere semidiurnal tides at Christchurch (44S) and Scott Base (78S),** *Journal of atmospheric and terrestrial physics,* July 1995, 57(8), p.857-869, 17 refs.

Lunar and solar semidiurnal tides have been determined from wind measurements in the 82 to 100 km height range at Christchurch and Scott Base made during 1983-84. At Christchurch, the solar tide has maximum amplitudes in Apr. and Dec., while at Scott Base only the Dec. maximum is present at all heights. Phases at Scott Base mostly agree with those measured earlier at Mawson, but vertical wavelengths are always long. The lunar tide was difficult to isolate at Christchurch, but the winter to summer phase reversal was clear. This was also seen at Scott Base. (Auth.)

Leonard, J.M., Pinnock, M., Rodger, A.S., Dudeney, J.R., Greenwald, R.A., Baker, K.B., **Ionospheric plasma convection in the Southern Hemisphere,** *Journal of atmospheric and terrestrial physics,* July 1995, 57(8), p.889-897, Refs. p.895-897.

The first ionospheric plasma convection maps ordered by the *y*- and *z*-components of the IMF using only data from the Southern Hemisphere are presented. These patterns are determined from line-of-sight velocity measurements of the Polar Anglo-American Conjugate Experiment (PACE) located at Halley Station, with the majority of the observations coming from 65-75° magnetic latitude. For IMF Bz positive and negative conditions, the observed plasma motions are consistent with a standard two-cell pattern. For periods from dusk through midnight to dawn, flow speeds are at least twice as large for Bz negative component as for Bz positive. The observations about noon are significantly different from each other. For Bz positive, little ordered plasma motion is observed. For Bz negative, there are large anti-sunward flows the orientation of which is ordered by IMF By. These By oriented flows are consistent with theoretical predictions, and are anti-symmetric to those reported from the Northern Hemisphere. (Auth. mod.)

Ul'ev, V.A., Shirochkov, A.V., Moskvin, I.V., Hargreaves, J.K., **Midday recovery of the polar cap absorption of 19-21 March 1990: a case study,** *Journal of atmospheric and terrestrial physics,* July 1995, 57(8), p.905-915, 16 refs.

The effect of the midday recovery of absorption (MDR) during the polar cap absorption (PCA) of Mar. 19-21, 1990 is investigated using data from 25 riometer stations in both hemispheres. The measured variations of absorption are compared with those calculated from a model. Three main aspects are considered: the solar and geophysical conditions under which the effect appears; the essential morphological features of the phenomenon; and the relative contribution of diurnal variations in the geomagnetic cut-off energy and an anisotropic pitch-angle distribution of the solar protons to the development of the MDR. There are solid reasons to suggest that MDR at latitude 65-70° is due to the combined influence of a diurnal variation of geomagnetic rigidity and the pitch-angle anisotropy of solar protons. The MDR at lower latitudes (Λ=60-65°) seems to be produced primarily by diurnal variations of the cut-off rigidity. (Auth. mod.)

Barr, R., **Simple theoretical model for computing omega navigation errors near Antarctica,** *Journal of atmospheric and terrestrial physics,* July 1995, 57(8), p.961-966, 13 refs.

The propagation of VLF signals around a model icecap has been computed using Kirchhoff diffraction theory. The antarctic continent has been modelled as a spherical cap, whose pole is coincident with that of the South Pole, which totally absorbs VLF radio waves propagating over it. Using this simple model, the range errors expected whilst travelling between Antarctica and New Zealand, on signals from Omega La Reunion and Argentina, have been calculated and compared with recently derived measurements. In order to model the measured range errors accurately it has been necessary to modify the simple spherical cap model to that of a semi-circular spherical cap, producing what is effectively knife edge diffraction. To 'best fit' the data, the northernmost limit of the spherical cap has been found to be 66.1°S for propagation from La Reunion and 75°S for propagation from Argentina. These model icecaps agree well with the northernmost boundary of the antarctic continent where signals from Omega La Reunion and Argentina graze it tangentially. (Auth.)

Dudeney, J.R., Rodger, A.S., Smith, A.J., Jarvis, M.J., Morrison, K., **Satellite Experiments Simultaneous with Antarctic Measurements (SESAME),** *Space science reviews,* Feb. 1995, 71(1-4), p.705-742, Refs. p.739-742.

Satellite Experiments Simultaneous with Antarctic Measurements (SESAME) is one of the four ground-based programs within the NASA/ISAS Global Geospace Science (GGS) mission. The scientific objectives of SESAME are carefully selected to make an invaluable contribution to the GGS mission by capitalizing on the unique geophysical advantages of Antarctica for geospace research. These arise mainly from the large displacement of the geographic and geomagnetic poles. Specifically, SES-

AME is designed to study the ionospheric effects of merging at the magnetopause, reconnection in the geomagnetic tail and its relationship to substorms, mapping of significant geospace boundaries to ionospheric altitudes, plasma wave generation and propagation at high latitudes, and ionosphere-thermosphere interactions. The experimental program is centered at Halley Station but also uses automatic geophysical observatories located poleward of Halley. The data products that will be supplied as key parameters to the GGS experiments on a routine basis are described. (Auth. mod.)

Sivjee, G.G., Walterscheid, R.L., **Six-hour zonally symmetric tidal oscillations of the winter mesopause over the South Pole Station,** *Planetary and space science,* June 1994, 42(6), p.447-453, Refs. p.452-453.

Four complete cycles of a 6-h quasi-monochromatic variation in OH Meinel (3,1) and (4,2) band airglow brightness (I) and rotational distribution temperature (T) were observed with a near infrared (1.0-1.7 μ) Michelson interferometer operating at Amundsen-Scott Station. The simultaneous occurrence of a quasi-periodic variation in I and T suggests the presence of a coherent wave phenomenon in the mesopause. A power spectral density analysis of a continuous 24-h recording of I and T on May 24, 1992 indicates a 6±1-h period oscillation. Unlike the globally dominant migrating tides, and other zonally propagating tides, for which the quantities that generate airglow fluctuations vanish at the pole, the 6-h zonally symmetric standing tide has its maximum amplitude in these quantities at the poles. To examine whether observed airglow variations were consistent with a zonally symmetric non-migrating tide, comparisons with airglow theory were made in terms of Krassovsky's ratio. The observed value was 9±3 for amplitude and 30°±15° for phase, with I leading T. The agreement with the predicted amplitudes is good for modes which are sharply peaked near the pole. (Auth. mod.)

Miller, T.C., **Feasibility tests and design of AMANDA (Antarctic muon and neutrino detector array),** Berkeley, University of California, 1993, 246p., University Microfilms order No. 94-30611, Ph.D. thesis. Refs. p.239-244.

The AMANDA (Antarctic Muon and Neutrino Detector Array) is a large area, high-energy neutrino detector whose primary purpose is the identification of astrophysical sources of very high energy neutrinos. AMANDA will consist of 10 vertical strings of downward-facing 20 cm photomultiplier tubes (PMTs), located in clear antarctic ice at 1 km depth. Neutrinos will be detected indirectly via Cerenkov light emitted in ice by muons produced in neutrino interactions below the array. The incident neutrino direction will be determined from the timing and pulse height information in many PMTs. The author first reviews potential astrophysical high energy neutrino point sources. Second, he describes the planned AMANDA array, including detailed descriptions of hardware, electronics, and data acquisition, and then describes experimental results on AMANDA to date. The feasibility of the AMANDA project depends critically upon the optical clarity of antarctic ice. Measurements of ice transparency at 200 m depth in Greenland during 1990 and at 800 m depth at the South Pole during the 1991-92 and 1992-93 austral summers were consistent with the peak optical attenuation length of 25 m that has been measured in laboratory ice. Takahashi, Y., Okano, S., Ono, T., Fukunishi, H., **Imaging and photometric observations of proton aurora dynamics at Syowa Station, Antarctica,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.8, Tokyo, National Institute of Polar Research, Mar. 1995, p.1-6, 6 refs.

Using auroral data obtained with a multicolor all-sky imaging system (MAIS) and a tilting-filter photometer at Showa Station, the authors investigated the dynamics of proton auroras (Hβ emissions) and its relation to electron aurora dynamics. An all-sky SIT camera was also operated to monitor electron auroras. Some 4300 proton aurora images were obtained with MAIS on 29 nights from May to Sep. 1992. These data cover the magnetic local time sector from 14 h to 4 h and include various types of proton auroras in different substorm phases. It is found that when bright N-S auroras are seen in the bulge formed in an auroral breakup event, the region of proton aurora contracts poleward as the electron aurora in the bulge fades out; when there are no N-S auroras in the bulge, the proton aurora remains equatorward. (Auth.)

Ejiri, M., et al, **Experimental results of Polar Patrol Balloon project in Antarctica. (Extended abstract),** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.8, Tokyo, National Institute of Polar Research, Mar. 1995, p.60-64, 9 refs.

A long-term circumpolar balloon experiment, the Polar Patrol Balloon (PPB) project, aims at establishing a PPB system to carry scientific payloads into the stratosphere over the antarctic region. Six PPB experiments were planned and carried out from 1990 to 1993 as an antarctic STEP project. PPB 1 accomplished a complete circumpolar flight over Antarctica. The 2nd flight was launched on Jan. 5, 1991 to make measurements of auroral X-rays, magnetic and electric fields. The 3rd flight was carried out on Sep. 23-28, 1991 when the antarctic ozone hole was well developed, in order to investigate the chemical source and sink of ozone. PPB 4 and 5, with payloads of vector magnetic and electric fields and auroral X-rays, were launched on Dec. 26 and 30, 1992, respectively. PPB 6 aimed at studying the elemental and isotopic composition of galactic cosmic rays, solar energetic particles and cosmic gamma ray bursts, and was launched on Jan. 5, 1993. Results are discussed.

Igarashi, K., Ohtaka, K., Kunitake, M., Tanaka, T., Ogawa, T., **Development of scanning-beam VHF auroral radar system. (Extended abstract),** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.8, Tokyo, National Institute of Polar Research, Mar. 1995, p.65-69, 5 refs.

VHF radar observations at Showa Station have been made since 1966 as routine ionospheric observations. In order to cover the whole echo region, a new 50 MHz scanning-beam VHF auroral radar with two sets of array antennas was developed. This radar is capable of observing the whole region of radio auroral echoes which is generated by E-region irregularities. A plasma drift velocity map is available every several minutes. The aim is to conduct simultaneous observations with the HF radar which will be installed at Showa Station. It is possible to compare the E-region and F-region plasma drift velocities simultaneously. Four observation modes are available, including meteor echo observation mode.

Kodama, M., Suzuki, H., Hirasima, Y., Yamagami, T., Murakami, H., Nishimura, J., **Circumpolar observation of bremsstrahlung X-rays by a polar patrol balloon over Antarctica,** *Journal of geomagnetism and geoelectricity,* 1995, 47(3), p.253-266, 29 refs.

This is a preliminary report of the first Polar Patrol Balloon (PPB) observation for auroral X-rays which occur widely in the south polar region. PPB No.6 was launched from Showa Station on Jan. 5, 1993, and flew one and a half circumpolar paths. Distinct enhancements of bremsstrahlung X-rays measured by an omnidirectional scintillation counter were often observed during the flight period of 27 days with low to moderate geomagnetic activity. Auroral X-ray enhancements observed at >65° invariant latitude show that their energy spectra progressively harden in the time interval from 6 to 18 h MLT. Time profiles of the enhancements are well characterized by the systematic E_0-flux relation, indicating that E_0s are held within a definite range during the enhancement; otherwise they vary, taking a minimum (or maximum) at the peak flux. This may suggest that two different modes of energetic electron precipitation are accompanied by stationary or variational spectra from onset to recovery of the enhancement. (Auth. mod.)

Rees, D., Hernandez, G., Smith, R.W., **Thermospheric dynamics in the southern polar region,** *Advances in space research,* 1995, 16(5), p.3-15, 24 refs.

The dynamical behavior of the upper thermosphere in the southern polar region has been investigated for a range of solar and geomagnetic activity and as a function of season, using a series of simulations by a coupled thermosphere-ionosphere model. The predicted behavior in the southern winter period can be compared with recent ground-based Fabry-Perot interferometer observations of the OI ^{1}D emission from the Amundsen-Scott Station at the South Pole. (Auth.)

K-53201

Smith, R.W., Hernandez, G., **Upper thermospheric temperatures at South Pole,** *Advances in space research,* 1995, 16(5), p.31-39, 23 refs.

Six years of upper thermospheric temperatures measured using 630 nm emission in the vicinity of Amundsen-Scott Station have been analyzed both on a daily and hourly averaged basis to compare observed behavior with that predicted using the MSIS86 semi-empirical atmospheric model. Daily averaged temperatures are in good general agreement, but the response of the model to geomagnetic activity appears to be too weak to match the observed changes near the peak of the solar cycle. Observed diurnal temperature variations are very similar in amplitude and phase to those predicted by MSIS86. Observed mean temperature gradients indicate that the maximum temperature in the polar cap could well be 200K higher than the maximum seen at Amundsen-Scott Station and at a position geomagnetically higher in latitude. The highest observed temperatures are found on the geomagnetic nightside associated with the exit of the cross-polar thermospheric jet towards lower latitudes; the lowest temperatures are observed on the geomagnetic dayside in the region of inflow to the polar cap. No signature of cusp heating was found. (Auth. mod.)

K-53202

Conde, M., Dyson, P.L., **Thermospheric horizontal winds above Mawson, Antarctica,** *Advances in space research,* 1995, 16(5), p.41-52, 23 refs.

High-resolution (R=200,000) nighttime Fabry-Perot spectra of the 630 nm thermospheric airglow emission obtained from Mawson Station during the winter of 1992 have been used to provide estimates of thermospheric temperature and neutral wind. Horizontal winds observed on individual nights varied in a continuous manner between two limiting patterns. At one extreme the wind blew at all times in an anti-sunward direction across the pole. The other extreme had anti-sunward winds around magnetic midnight but sunward wind in the magnetic afternoon and evening sectors and, on some occasions, the morning sector as well. It is postulated that the relative strengths of the temperature gradient and ion drag forces determined where a given night fell in this continuum of patterns. Averaged winds from subsets of the data selected according to season and magnetic activity were used to examine the relative influences of these factors. The authors found solar activity variations to be stronger at higher levels of geomagnetic activity. Comparison with the VSH wind model was also made. (Auth. mod.)

Scheer, J., **What can be learned from rotational temperatures derived from ground-based airglow observations about the aeronomy of the Southern Hemisphere,** *Advances in space research,* 1995, 16(5), p.61-69, 16 refs.

Ground-based measurements of rotational temperatures from the O_2 atmospheric and OH bands provide information about the dynamics of the upper atmosphere that is not easily accessible by other means. The spatial density of measuring stations of any kind, capable of determining temperatures in the 80-100 km altitude range, is quite low in the entire Southern Hemisphere, making airglow data very important. In Argentina, a tilting filter spectrometer has been in operation during a number of campaigns since 1984, giving temperatures of OH(6-2) at 86 km and of O_2(0-1) at 95 km with high temporal resolution (1.5 min). An overview of the results to date is presented. (Auth. mod.)

K-53204

Hernandez, G., Smith, R.W., Fraser, G.J., **Antarctic high-latitude mesospheric dynamics,** *Advances in space research,* 1995, 16(5), p.71-80, 14 refs.

The ground-based dynamical investigations of the mesosphere made at high austral latitudes from Amundsen-Scott Station and Scott Base are reviewed and discussed. The observations at these two locations show that atmospheric oscillations are reduced to zonal wavenumber zero and wavenumber one as the rotational pole is approached. These results have been theoretically explained as a natural extension of the solution of Laplace's Equation in the region near the rotational axis. The unambiguous confirmation of the theoretical results is possible because of the simultaneous measurement capability by the ground-based experiment of the wind field, kinetic temperature and emission rate. Von Biel, H.A., **Ground based radar investigation of the antarctic mesosphere,** *Advances in space research,* 1995, 16(5), p.91-98, 13 refs.

The operating principles and physical manifestation of a 2.9 MHz partial reflection program at Scott Base are described. Data from this program have been collected on an hourly basis since 1982, and these data have revealed that during the antarctic summer months (Nov. to Mar.), ionization appears to exist occasionally at a height of about 50 km. This phenomenon is observed about 20% of the time during these months. It is shown that this ionization might well have been produced by relativistic (about 1.5 to 4 MeV) electrons. (Auth.)

Dyson, P.L., Parkinson, M.L., Quach, A.D., Smith, P.R., Monselesan, D.P., **Radio studies of the Southern Hemisphere high-latitude ionosphere,** *Advances in space research,* 1995, 16(5), p.103-112, 29 refs.

This paper is a brief review of the use of radio probing techniques being used in Antarctica. It is important to study the antarctic ionosphere in order to understand conjugate effects and the result of differences in north-south symmetry such as the greater offset between the geographic and geomagnetic poles which occurs in the Southern Hemisphere. The main radio techniques being used in Antarctica are HF auroral radars, digital ionosondes and satellite beacon observations. Current developments of the SHARE HF radar system, installation of additional digital ionosondes, and the installation of GPS receivers which can provide TEC data, will all provide significant advances in the study of the antarctic ionosphere. Observations of storm effects at sub-auroral latitudes, obtained using a digital ionosonde operating as an oblique HF radar, are presented. (Auth. mod.)

Holzworth, R.H., Hu, H., **Global electrodynamics from superpressure balloons,** *Advances in space research,* 1995, 16(5), p.131-140, 33 refs.

Electric field and conductivity measurements in the stratosphere between Nov. 1992 and Mar. 1993 have been made using superpressure balloons in the Southern Hemisphere. Over 400 payload-days of data have been obtained during a record setting experiment called ELBBO (Extended Life Balloon Borne Observatories). This experiment resulted in 4 flights aloft simultaneously for over 2 months, including one flight which lasted over 4 months. Electrodynamical coupling between the atmosphere and ionosphere is studied using the measured electric fields and a simple empirical model of the stratospheric conductivity. Effects and dynamics of the global circuit suggest that standard models omit significant phenomena. Large-scale ionospheric convection activity has been studied from the polar cap to the middle latitudes. Cusp latitude fields have been continuously measured for many days in a row. (Auth. mod.)

Morris, R.J., Monselesan, D.P., Klekociuk, A.R., **Australian antarctic middle and upper atmospheric physics: a new direction,** *Advances in space research,* 1995, 16(5), p.151-162, 21 refs.

The distribution of Australian antarctic stations provides a unique platform for remote sensing of the high-latitude middle and upper atmosphere. A recent national review on antarctic science has resulted in new priorities for Australia's antarctic physics program, with future research focussing on science of practical value or of relevance to global change. This paper presents a brief overview of the scope of that program, with emphasis on the recent deployment of a 'Digisonde Portable Sounder' (DPS-4) at Casey Station and a lidar to be commissioned at Davis Station. Preliminary results from the DPS-4 will be presented showing the behavior of the polar cap ionosphere over Casey, including diurnal and seasonal effects. Differences were observed in seasonal convection patterns and the implications of such variations are discussed in terms of convection models. Secondly, a high spectral resolution lidar system is under development for the detailed study of the middle and upper atmosphere above Davis Station. The lidar will routinely profile density, temperature, wind velocity and aerosol loading of the bulk atmosphere at high spatial and temporal resolution, for the assessment of climate change and the study of dynamical processes. Sazhin, S.S., Bullough, K., **Theoretical studies of the inner magnetosphere based on whistler-mode wave data from the antarctic stations,** British Antarctic Survey Antarctic Special Topic Award Scheme Round 2 Symposium, Sep. 30-Oct. 1, 1992. Proceedings. University research in Antarctica, 1989-92, edited by R.B. Heywood, Cambridge, British Antarctic Survey, 1993, p.5-16, Refs. p.15-16.

A wide range of theoretical studies of whistler-mode waves observed at Faraday and Halley stations is presented with particular emphasis on the application of the results to diagnostics of parameters of the inner magnetosphere. It is pointed out that the nonlinear frequency shift in NAA and NSS signals observed at Faraday can be of the same order of magnitude or larger than the Doppler shift due to the movement of the magnetospheric ducts. This should be taken into account when interpreting the observed frequency shift and when using it for the diagnostics of the large scale electric field in the magnetosphere. The magnetospheric electron temperature is estimated by analysis of the upper branch of the nose whistlers. A model of hiss-triggered chorus emissions consistent with the results of observations is suggested. (Auth. mod.)

Portniagin, IU.I., Forbes, J.M., Fraser, G.J., Vincent, R.A., Lysenko, I.A., Makarov, N.M., **Dynamics of the antarctic and arctic mesophere/lower thermosphere regions,** *Advances in space research,* Oct. 1992, 12(10), Earth's middle and upper atmosphere, edited by J.M. Forbes et al, p.(10)89-(10)96, 12 refs.

The dynamics of the antarctic and arctic mesopause regions (ca. 95 km) are investigated through comparative analyses of winds measured by radar at Scott Base, Molodezhnaya, and Mawson Stations in the Antarctic, and the near-conjugate stations of Heiss I. and Poker Flat in the Arctic. The data are analyzed specifically to delineate hemispheric differences in mean monthly prevailing and semidiurnal tidal wind climatologies, and show the circulation systems in the arctic and antarctic mesosphere and lower thermospheres to exhibit significant asymmetries and interannual variability. In addition, circulation patterns at nominal latitudes of 67 and 80° within a given hemisphere differ quite substantially, suggesting existence of a higher-latitude circulation system in addition to the well-documented middle latitude one that extends at least between 35-70° in each hemisphere. Existing empirical and numerical models are shown to be deficient in reproducing some salient characteristics of these high-latitude circulation systems. (Auth.)

Balmforth, H.F., Moffett, R.J., Smith, A.J., Bailey, G.J., **Effect of disturbed-time electric fields on the inner plasmasphere,** *Annales geophysicae,* May 1994, 12(4), p.296-303, 27 refs.

Results from a mathematical model provide a description of the mid-latitude, low L-shell ionosphere and plasmasphere. Variations in the composition and dynamics of the plasmasphere and changes in the nature of the coupling between the plasmasphere and the ionosphere are studied for moderately disturbed conditions. Modelled results are compared to group delay and Doppler shift measurements of whistler mode signals at Faraday Station (L≈2.5), to investigate the effects of disturbed time electric fields on the inner plasmasphere and ionosphere. The disturbed time electric field causes a rapid outward drifting of the plasma leading to a decrease in modelled plasmaspheric electron density at a fixed L-value, which agrees with experimental observations. During the periods of outward drift, the modelled coupling flux is upwards to the plasmasphere which can lead to a significant depletion of N_mF2 values. (Auth.)

Cartron, S., Vila, P., **Polar lacuna on ionograms. I: Brief morphology,** *Annales geophysicae,* May 1994, 12(4), p.355-358, 11 refs.

Causes of polar F lacuna, or complete disappearance of F layer traces on polar cap ionograms, are reexamined using data selected from thirty years of records at Dumont d'Urville Station (South Magnetic Pole invariant latitude L=-80.5). The nature and definition of the polar lacuna are reviewed. Constraints of the respective ionosonde equipment are evaluated and the reality of F2 lacuna is verified by high-resolution ionogram f-plots. Diurnal and seasonal characteristics of hourly lacuna occurrences are summarized for F1 and F2 lacunae and for type “F3”, F1 and F2 lacunae together. From the 60-s series at Dumont d'Urville, distinctive lifetimes and precursor phenomena for the three types are discussed. This evidence suggested a common origin for E and F layer lacunae. The high-latitude structure of the mean winds and tides is described in this paper using climatologies prepared from radar data during the Atmospheric Tides Middle Atmosphere Program. The monthly evolution of the amplitude and phase of the tides is discussed. Comparison between the Southern and Northern Hemispheres indicate that the diurnal tide is stronger in the Southern Hemisphere and that the antisymmetric diurnal tidal modes are dominant. The semidiurnal tide is larger than the diurnal tide. The vertical wavelength structure is significantly different between the Southern and Northern Hemisphere. Comparisons with recent tidal models show several discrepancies. Antarctic stations providing observational radar data for this program include Mawson and Scott Base.

Von Biel, H.A., **Geomagnetic time and position of a terrestrial station,** *Journal of atmospheric and terrestrial physics,* Sep. 1990, 52(9), p.687-694, 12 refs.

The concepts of geomagnetic time and position of a station on Earth are reviewed on the basis of the centered dipole, and the eccentric dipole, magnetic field approximations. Equations are presented from which the centered dipole coordinates can be computed as a special case of the eccentric dipole coordinates. It is also shown that several aspects relating to geomagnetism appear to vary nearly linearly with time and are well represented by linear regression equations which can significantly simplify subsequent computations. Sufficient information is included so that magnetic time and position for any station on Earth may be calculated. Sample results are presented which specifically relate to Scott Base, Antarctica. Stoker, P.H., **Relativistic solar proton events,** *Space science reviews,* Aug. 1995, 73(3-4), p.327-385, Refs. p.381-385.

Ground level enhancements from solar flare protons have been recorded at SANAE Station since 1971 by two neutron monitors with different sensitivities to primary protons in the rigidity range from <1 GV to ≈5 GV. Spectral indexes of about 20 of these more energetic solar flare proton events have been determined from the two detector enhancements recorded at SANAE. These indexes do not show any increase (softening of the relativistic proton spectra) with increasing heliolongitude away from the preferred IMF connection region as was obtained for 20-80 MeV protons. Furthermore, most of the enhanced count rates show fluctuations larger than statistical, indicative of propagation in a mostly turbulent interplanetary magnetic field. (Auth. mod.)

Besprozvannaia, A.S., Vovk, V.IA., Eliseev, A.IU., Lukashin, V.M., Moskvin, I.V., Khodzha-Akhmedov, Ch.L., **Peculiarities of the *F*2 MOF diurnal variations at the subauroral antarctic radio line Bellinsgauzen-Molodezhnaya,** *Geomagnetism and aeronomy,* Jan./Feb. 1994 (Pub. Aug. 94), 34(1), p.107-110, Translated from Geomagnetizm i aeronomiia. 13 refs.

This paper presents analysis of *F*2 MOF (maximum observed frequencies) diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya for winter and summer conditions of a high solar activity epoch. A comparison of *F*2 MOF experimental data with maximum applicable frequency magnitudes, which are calculated with a refraction integral method, was carried out. In the calculation the authors used the model of subauroral ionosphere developed for description of the atmosphere of the Southern Hemisphere. It is shown that the observed features of *F*2 MOF diurnal variations (an additional maximum in winter and a 180° turn of the maximum phase of *F*2 MOF diurnal variation when going from winter to summer) can be explained in terms of ionosphere peculiarities and of the conditions of radio wave propagation along the radio line. Vovk, V.IA., Egorova, L.V., Moskvin, I.V., **Evaluation of correlation between variations of absorption of cosmic noise and near-Earth atmospheric pressure in Antarctica,** *Geomagnetism and aeronomy,* Jan./Feb. 1994 (Pub. Aug. 94), 34(1), p.118-120, Translated from Geomagnetizm i aeronomiia. 7 refs.

Effects of the corpuscular and electromagnetic radiation of the sun on variations of near-earth atmospheric pressure from riometric data at stations in the polar cap and auroral zone are discussed. According to data from the stations at Vostok, Molodezhnaya and Mirnyy, a maximum of anticorrelation between the data of the riometric absorption and atmospheric pressure is observed in periods of proton flares at a shift of 12-60 hours. A minimum lag of the beginning of pressure variations is observed at Vostok Station at the beginning of the polar cap absorption event in the morning hours. This corresponds to the effects of solar cosmic rays (SCR) with a cutoff latitude of 80° and a particle energy of 10^6-10^7 eV over the polar cap region, and to variations caused by SCR in the atmosphere transparency and an abrupt pressure drop at latitudes of 80° immediately after the flare. Rasch, D.J., Essex, E., **Quasi-periodic scintillation events at southern auroral latitudes,** *Journal of atmospheric and terrestrial physics,* June 1994, 56(8), p.949-960, Refs. p.959-960.

Quasi-periodic (QP) radio scintillations were observed during 1987 on 244 MHz and 1.5 GHz geostationary satellite transmissions in the southern auroral zone from Davis Station. Three distinct types of QP events were identified, with occurrence times mainly restricted to the period 18-00 MLT. The substantial loss of signal associated with these events appears to be an important factor in determining the reliability of satellite links on 1.5 GHz in auroral regions. Previous observations at mid-latitudes of QP scintillations have noted a preference for large zenith angles and equatorward azimuths. It is demonstrated that a height transition in a densely ionized layer can produce QP scintillations in a manner analogous to a dense column of ionization but at lower ionization densities, as well as demonstrating a zenith angle and azimuthal dependence that is more consistent with observations than a column of ionization. (Auth.)

Weatherwax, A.T., LaBelle, J., Trimpi, M.L., Brittain, R., **Monitoring natural low-frequency/medium-frequency/high-frequency radio emissions from remote sites,** *Antarctic journal of the United States,* 1993, 28(5), p.303-305, 16 refs.

To gain a better understanding of auroral LF/MF/HF emissions, a ground-based effort has been started in Antarctica to study this part of the spectrum. Currently, radio receivers are being operated at Amundsen-Scott Station and at the first U.S. automatic geophysical observatory (AGO) site called P2. The South Pole receiver has been operating since the 1992 season, whereas the AGO receiver was deployed last year; AGO data should be available for analysis in winter 1993. Operation of the receivers in Antarctica not only will complement the work currently underway in the Northern Hemisphere (Alaska) but also should provide a lower noise environment for observations, since manmade interference should be minimal. A figure shows a block diagram of the Dartmouth LF/MF/HF receiver. Another figure shows 30 min. of data recorded on July 5, 1992, at Amundsen-Scott Station.

Bersanelli, M., et al, **Absolute measurements of the cosmic microwave background from Amundsen-Scott South Pole Station,** *Antarctic journal of the United States,* 1993, 28(5), p.306-308, 12 refs.

Studies of the cosmic microwave background (CMB) were carried out during two antarctic expeditions, in Nov. and Dec. of 1989 and again in 1991, at the Amundsen-Scott Station. The accuracy of the measurements at frequencies below approximately 2.5 GHz is limited by the subtraction of galactic emission due to synchrotron and free-free radiation, a foreground signal that cannot be eliminated by the choice of observing site. The authors model the galactic contribution based on low-frequency maps scaled at the frequency and angular resolution of their instruments and test the model assumptions with differential scans. They are presently involved in a long-term effort to improve their knowledge of the galactic emission and spectral index, a step necessary for future improvement of low-frequency measurements of the CMB spectrum.

De Amici, G., et al, **Low-frequency maps of the galactic radio emission,** *Antarctic journal of the United States,* 1993, 28(5), p.308-310, 4 refs.

The authors have performed an experiment in the operation and management of large equipment outdoors in the polar climate and have collected valuable information to use in the design and implementation of the next generation of receivers and instruments for mapping of galactic emission. Because the interfering signals have very narrow bandwidths, usually less than 2% of their receiver's, it is planned to use a correlator in the data acquisition. The correlator will subdivide the input signal into several narrow channels (approximately 40) and proportionally boost the effective amplitude of the narrow-band interference, making it easier to recognize and excise. This will increase confidence in the accurate subtraction of RF interference by a similar factor.

Gaisser, T.K., et al, **Results from the South Pole air shower experiment,** *Antarctic journal of the United States,* 1993, 28(5), p.310-311, 3 refs.

The South Pole air shower experiment (SPASE) is operated jointly by the Bartol Research Institute of the University of Delaware and the Department of Physics of the University of Leeds, England. The air shower array consists of 24 1-m^2 scintillator detectors, 16 of which have timing capacity. The detectors are separated by approximately 30 m. The arrival times of the signals in the detectors define the direction of the cascade of particles produced when an energetic cosmic ray enters the atmosphere. The purpose of this experiment is to search for point sources of ultra-high-energy photons above the constant background of cosmic ray nuclei. The array has operated almost continuously since being deployed in the austral summer of 1987.

Vinje, W., et al, **Neutrino detection with the radio-Cherenkov method: description and preliminary studies,** *Antarctic journal of the United States,* 1993, 28(5), p.311-314, 9 refs.

During the 1991-92 field season, the authors operated a prototype UHE neutrino detector, the antarctic radio-Cherenkov neutrino observatory (ARCNO), at the Amundsen-Scott Station. ARCNO was built to gain experience in using the "radio-Cherenkov" (RC) method of neutrino detection. The RC method is not yet widely known because only one other group has undertaken preliminary experiments (the radio antarctic muon and neutrino detector, RAMAND). The major neutrino detector currently under construction at the South Pole, the antarctic neutrino and muon detector array (AMANDA), does not use the RC method. Instead, AMANDA looks for the optical-Cherenkov (OC) signal using buried strings of photomultiplier tubes. The OC signal is much stronger than the RC signal; however, the OC signal can travel only short distances in ice (approximately 20 m).

Bering, E.A., III, Benbrook, J.R., Chadwick, R., Byrne, G.J., Few, A.A., Morris, G.A., **Feasibility of long-term vertical electric current measurements in the Antarctic,** *Antarctic journal of the United States,* 1993, 28(5), p.314-317, 4 refs.

The authors have suggested that snapshot measurements of the electric potential of the ionosphere should be possible by making measurements of the vertical electric current at a network of manned and unmanned sites in Antarctica, including the U.S. automated geophysical observatories (AGOs). Implementation of this idea required a proof-of-concept test at the South Pole. Two concerns were posed. First, the effect of turbulence in the planetary boundary layer (PBL) on the proposed measurements was unknown. Second, new instruments might need some field-testing and development before being considered qualified for inclusion in the AGO environment. This paper reports on the experimental evaluation of these two concerns.

Smith, R.W., Hernandez, G., Price, K., **Optical measurements of ion drift from South Pole Station,** *Antarctic journal of the United States,* 1993, 28(5), p.317-320, 13 refs.

Ion drifts and temperatures were measured by an optical method from Amundsen-Scott Station and compared with the neutral winds and temperatures simultaneously observed from the same station. Ion drift distributions showed that whereas there was no consistent trend in the magnetic meridional directions, a definite preference for westward ion drifts was observed. A similar trend was found for the zonal neutral winds, but the magnitude of the westward neutral trend was about half the magnitude for ions. The neutral vertical winds were much less variable than the ion velocities measured in the same direction. Ion and neutral temperatures had mean values of 1,152 K and 939 K, respectively, but unlike the result for neutral temperatures, there was a distinct tail to the distribution of ion temperatures toward high values. Evidence is presented that the ion and neutral data were measured at the same altitude in the F-region ionosphere; therefore, the authors conclude that the ions were 213 K hotter on average over the observing period.

Clark, K.C., Hernandez, G., Schulz, W.J., Smith, R.W., **Optical all-sky viewing double dome for South Pole Station,** *Antarctic journal of the United States,* 1993, 28(5), p.320-323.

A full and clear view of the sky by optical instruments during the austral winter at the South Pole requires special attention to critical design features of the optical ports which protect the immediate components, such as all-sky mirrors, from the severe cold and associated frosting. An evolving system of double-domes and internal heating has successfully served the optical aeronomic studies of the dynamics of the upper atmosphere by Fabry-Perot spectrometry, which are now in their fifth continuous year. This protective optical port is described and discussed here to aid future experimenters who need to make dependable sky measurements under the extreme environmental conditions of the antarctic plateau.

Arnoldy, R.L., Popecki, M.A., Engebretson, M.J., **Identifying the source of magnetic pulsations of frequency between 0.1 and 0.4 hertz (Pc 1/2) measured at high geomagnetic latitudes,** *Antarctic journal of the United States,* 1993, 28(5), p.323-325.

To determine what information is possibly contained in the high-frequency range of ultra-low-frequency (ULF) waves [greater than 0.1 hertz (Hz)], data from ground sensors located at Søndre Strømfjord in Greenland and at Amunsden-Scott and Siple stations were analyzed over a period of one year in spectrogram format to give the frequency character of the ULF signals from these sites. Søndre Strømfjord and Amundsen-Scott nominally sample the poleward border of the auroral oval or the cusp/cleft region on the dayside and are fairly conjugate within 2 hours of local time. Siple Station is a plasmapause station measuring ULF wave activity deep within the magnetosphere. Study results indicate that a large percentage of the high-frequency ULF waves measured at high latitudes do not reflect what is happening at the boundary of the magnetosphere but rather are generated deeper within the magnetosphere.

Jefferies, S.M., Pomerantz, M.A., Duvall, T.L., Jr., Harvey, J.W., **Helioseismology from the South Pole: closer connections with geoseismology,** *Antarctic journal of the United States,* 1993, 28(5), p.328-329, 8 refs.

The Amundsen-Scott Station was used as a helioseismic observing site in 1981, 1987, 1988 and 1990-91. The data obtained have allowed the authors to study the mean structure, asphericity, and rotation of the solar interior and the variations of these quantities with the level of solar activity. The majority of the studies have concentrated on the standing-wave properties of the oscillations. Measurement of the traveling-wave properties, for example wave travel-times and distances, has not been explored. In geoseismology, travel-time measurement is fundamental to developing three-dimensional pictures of the underlying structure of localized regions of the Earth. Standing-wave or free-oscillation measurement generally provides information only on the global properties of the Earth.

Bering, E.A., III, Benbrook, J.R., Lee, K., Clarady, C., Fujii, R., Kadokura, A., **Studies of ionospheric convection in the Southern Hemisphere using long-duration balloons,** *Antarctic journal of the United States,* 1993, 28(5), p.329-332, 7 refs.

The National Institute of Polar Research (NIPR), Japan, in collaboration with other institutions, has been conducting a series of long-duration balloon flights, called "polar patrol balloons" (PPB), since 1984 to study the ionosphere and magnetosphere above Antarctica. The authors have constructed and delivered two electric-field experiments that were flown on the payloads of two PPBs launched from Showa Station on Dec. 26 and 30, 1992. The first flight only lasted 8 days, but the second lasted considerably longer. Because of a failure in the telemetry encoder, data were not obtained after Jan. 13, 1993. It is concluded that the electric-field instruments functioned nominally throughout both flights, and the data appear to be of excellent quality; however, the analysis is still too preliminary to be reported here.

Besprozvannaia, A.S., Shchuka, T.I., Troshichev, O.A., **IMF effects in the appearance of slant E conditions (SEC) in the northern and southern polar regions,** *Journal of atmospheric and terrestrial physics,* Aug. 10, 1995, 57(10), p.1179-1183, 14 refs.

Vertical sounding data of the polar ionosphere are used to study slant E condition (SEC) related to the development of instabilities in the ionospheric plasma. The measurements from three arctic and three antarctic stations located respectively in the polar cap, daytime cusp and auroral zone are analyzed. It is shown that the SEC daily variations in these three regions are different. Distinctions between SEC features in the opposite hemispheres are affected by the azimuthal and vertical interplanetary magnetic field components. (Auth.)

Jones, G.O.L., Jarvis, M.J., **Springtime reduction in MF mesospheric echo occurrence,** *Geophysical research letters,* Aug. 15, 1995, 22(16), p.2123-2126, 19 refs.

Radar echoes from the upper mesosphere recorded by the dynasonde at Halley Station over four years have been studied to reveal the diurnal and seasonal characteristics of echo occurrence. In addition to the expected daily variation, a distinct seasonal change in the number and altitude of the echoes is apparent. The prevalence of echoes during the winter months is followed, in all four years studied, by a period during the antarctic spring when echo occurrence falls markedly for a period lasting for about three weeks. This dearth of echoes coincides with the breakdown of the polar vortex circulation pattern in the lower atmosphere, providing strong evidence of the neutral dynamical coupling between the stratosphere and mesosphere. Vennerstrøm, S., Friis-Christensen, E., Troshichev, O.A., Andresen, V.G., **Geomagnetic polar cap (PC) index 1975-1993,** Boulder, World Data Center A for Solar-Terrestrial Physics, 1994, 274p., Report UAG-103, 7 refs.

DLC QC833.G46

The first series of PC index values were published by WDC B in Moscow (See Troshichev et al., 1991), for the years 1975-1982. Here the authors present a reprint of this data series, together with a continuation for the years 1983-1993. PC is an index for magnetic activity in the (P)olar (C)ap. It is based on data from a single near-pole station, and is used to monitor the polar cap magnetic activity. This activity is generated by such solar wind parameters as the southward component of the interplanetary magnetic field (IMF), the azimuthal component of the IMF (B_y), and the solar wind velocity v. The station Thule, placed in the village Qaanaaq in Greenland at 86.5° geomagnetic invariant latitude, fulfills the requirement of being close to the magnetic pole in the Northern Hemisphere. The station Vostok does the same in the Southern Hemisphere. The PC index is derived independently for these two stations.

Saltus, R.W., Kucks, R.P., **Geomagnetic activity and its implications for the 1991-1992 CASERTZ aeromagnetic survey in Antarctica,** *American Geophysical Union. Antarctic Research Series,* 1995, 67(4), Contributions to antarctic research IV, p.9-17, 14 refs.

DLC G845.C67 vol.67, no.4, 1995

As part of aeromagnetic survey operations, the total field geomagnetic variation was recorded at the CASERTZ (Corridor Aerogeophysics of the South East Ross Transect Zone) base camp for 61 days from Nov. 16, 1991 to Jan. 16, 1992. This turned out to be a period of low worldwide geomagnetic activity. But, as is typical in Antarctica, geomagnetic variations exceeded 500 nT on noisier days. Comparison of the geomagnetic variation recorded simultaneously at several sites shows remarkably good agreement at distances of up to 200 km within the survey area, especially during magnetically quiet times. The design of the survey (5 km^2 flight grid) and a reduction technique combining removal of base station geomagnetic variation and adjustment of flightline intersections yields an aeromagnetic map accuracy of about 10 nT. (Auth.)

Buckley, R.G., Trodahl, H.J., **Radiation risk,** *Nature,* July 5, 1990, 346(6279), p.24, 8 refs.

It has been pointed out earlier that antarctic life forms have developed only minimal defences against increased ultraviolet radiation as the ozone hole over the continent has persisted and deepened in recent years and penetrated the UV transparent sea ice cover. In this brief essay, the authors report measurements showing an even larger seasonal variation in the UV than in the visible spectrum. Algae which are known to be sensitive to UV radiation are put at greater risk of underproducing in these areas and thus induce a strain on the food web in ice covered regions.

Cai, G., Geng, K., Wang, Q., **Environmental monitoring of the natural radiation background in Antarctica with LiF:Mg,Cu,P TLD and X-γ radiometry,** *Radiation protection dosimetry,* 1995, 60(3), p.259-262, 4 refs.

This paper describes the experimental results obtained with an X-γ radiometer and LiF:Mg,Cu,P thermoluminescence detectors for the measurement of natural radiation at Zhongshan Station. Two methods were adopted for the investigation: (1) thermoluminescence detectors for integrated dose; (2) X-γ radiometer (type BH3013) for the distribution of the dose rate. The experimental results show that the distribution of natural radiation levels in Antarctica is very uneven. Dose rates observed varied by a factor of 20. Further studies are needed to explain these results fully. (Auth. mod.)

Smith, D.M., Lin, R.P., Anderson, K.A., Hurley, K., Johns, C.M., **High-resolution spectra of 20-300 keV hard X-rays from electron precipitation over Antarctica,** *Journal of geophysical research,* Oct. 1, 1995, 100(A10), p.19,675-19,685, Refs. p.19,684-19,685.

In Dec. 1990, a set of liquid-nitrogen-cooled germanium hard X-ray and gamma-ray spectrometers was flown aboard a high-altitude balloon from McMurdo Station for solar, astrophysical, and terrestrial observations. This flight was the first circumnavigation of the antarctic continent by a large balloon. Bremsstrahlung hard X-ray emission extending up to ca. 300 keV from the precipitation of high-energy electrons was observed on 6 separate occasions over the auroral zone, all during low geomagnetic activity. All events were consistent with emission at the trapping boundary; observations over the polar cap showed no precipitation. The authors present the first high-resolution spectra of this hard X-ray emission in the energy range 20-300 keV. The observed count spectra are deconvolved by model-independent techniques to photon spectra and then to the precipitating electron spectra. The spectral hardness shows an inverse relation with L as expected. Results suggest that high-resolution spectroscopy could be extremely effective in characterizing electron precipitation if coupled with imaging capability. (Auth. mod.)

Kangas, J., Cao, C., **Pulsating aurora: a review,** *Antarctic research,* June 1995, 6(1), p.39-50, Refs. p.49-50.

The observational facts about pulsating aurorae are summarized and discussed in the frame of the recent development of theories which explain the mechanism of auroral pulsations. Although new data are available, some key observations in the magnetosphere are still missing in order to identify the wave mode to precipitate electrons into the atmosphere and in order to understand the role of magnetospheric plasma in producing pulsating aurorae. It appears that the Coroniti-Kennel or micropulsation theory needs to be re-visited, although the so-called flow cyclotron maser model seems to explain many of the characteristics of auroral pulsations. Skov, M.J., Kyle, P.R., **Mount Erebus Volcano Observatory: seismic observations,** *Antarctic journal of the United States,* 1993, 28(5), p.13-14, 5 refs.

A permanent seismic network was established during the 1980-81 field season as part of the International Mount Erebus Seismic Study (IMESS). During the 1992-93 field season, major changes were made to the Mount Erebus seismic monitoring system. The network currently consists of six short-period vertical-component seismometers arranged in two triangles. One triangle is located around the summit region; the second, lower on the mountain. These stations employ very-high-frequency radio telemetry to transmit data to the recording system at McMurdo Station. A seventh station is temporarily located in McMurdo and is wired directly to the data logger.

Roult, G., Rouland, D., **Antarctica I: Deep structure investigations inferred from seismology; a review,** *Physics of the earth and planetary interiors,* 1994, 84(1-4), p.15-32, Refs. p.30-32.

The strategic position of Antarctica and its role have always been seen as clues to the tectonic and geodynamic history of the Southern Hemisphere. Direct investigations are difficult, and seismology was, and still is, a very efficient tool for answering some important questions. Major seismological results from the beginning of the century to the present are reviewed, taking into consideration their limitations owing to the lack of stations and data. The existing regional Earth models reviewed are very simple because of poor processing facilities. The availability of high-quality data obtained with the GEOSCOPE network in this part of the Southern Hemisphere has recently led to the construction of maps of lateral heterogeneities of Antarctica with an improved resolution. A brief report of the authors' contribution is presented. (Auth.)

Roult, G., Rouland, D., Montagner, J.P., **Antarctica II: Upper-mantle structure from velocities and anisotropy,** *Physics of the earth and planetary interiors,* 1994, 84(1-4), p.33-57, Refs. p.56-57.

To improve the lateral resolution of three-dimensional seismic wave velocity models in Antarctica and the surrounding oceans, the authors have analyzed direct earthquake-to-station Rayleigh-wave data observed on the vertical high-gain long-period and the very long period components of 7 GEOSCOPE stations located in the Southern Hemisphere and 3 other stations at equatorial latitudes. The phase velocities of Rayleigh waves along 400 well-distributed paths were obtained in the period range 60-300 s, by fitting the data with synthetic seismograms computed with known source parameters in a reference earth model represented by the Preliminary Reference Earth Model (PREM). The results show some new and important features of Antarctica and the Southern Hemisphere. The locations of velocity anomalies are well resolved. The eastern part of Antarctica corresponds to a craton-like structure down to depths of about 250 km, with the highest velocities observed in Enderby Land, where some of the oldest rocks in the world have been sampled. The low velocities are located along the ridges encircling the antarctic continent. The lowest velocities appear in some areas corresponding to hotspots (Crozet, Kerguelen, Macquarie and Balleny Is.). Also, an elongated low velocity is found on the western flank of the Transantarctic Mountains which might be related to the existence of a rift zone similar to the African rift. The Australia-Antarctica Discordance (AAD) presents low velocities near the surface but high velocities below the lithosphere. (Auth. mod.)

Shu, P.Y., Zhang, B., **Crust-mantle structure under South Pole and Ross Sea beach in Antarctica,** *Antarctic research (Chinese edition),* Sep. 1994, 6(3), p.12-19, In Chinese with English summary. 12 refs.

A waveform comparison of theoretical seismograms with four teleseismograms recorded at Amundsen-Scott Station and at Scott Base shows that the crustal thickness beneath the South Pole is about 45 km, double layered structure, and that the crustal thickness below Ross Sea beach is single structure and about 24 km. At a depth of 350-450 km there is a low velocity layer. The above results indicate different tectonic characteristics on the two sides of the Transantarctic Mountains. (Auth. mod.)

Geletti, R., Pipan, M., Vesnaver, A., **Signal/noise ratio enhancement of seismic profiles in the Ross Sea (Antarctica),** *Bollettino di geofisica teorica ed applicata,* Mar.-June 1993, 35(137-138), Monograph on the Ross Sea Italian geophysical expeditions to Antarctica. Edited by I. Finetti and C. Roda, p.173-193, 3 refs.

Several seismic profiles by the OGS in the Ross Sea have been processed and interpreted. Attenuation of strong multiple reflections due to the frozen sea bottom and affecting the seismic records is the primary objective of this study. Various processing techniques were applied to improve the signal/noise ratio, such as weighted stack and iterated prestack *f-k* domain filtering; results obtained are reported and discussed. (Auth.)

Galuppo, P., Geletti, R., **Seismic signal enhancement of antarctic crustal data,** *Bollettino di geofisica teorica ed applicata,* Mar.-June 1993, 35(137-138), Monograph on the Ross Sea Italian geophysical expeditions to Antarctica. Edited by I. Finetti and C. Roda, p.195-202, Refs. p.201-202.

Most of the seismic data acquired in the Ross Sea are affected by a severe reverberation problem. The strongest reverberation energy comes from sea-bottom related multiple reflections. A simple CMP (Common Mid-Point) stack-based processing is not sufficient to overcome this problem. This is particularly true if the objective is deep reflectors. Therefore a reprocessing of some of the seismic line was done using specific, and in one case innovative, procedures. Application of the *f-k* domain multiple suppression method gave evidence of a deep reflection previously masked. The best result, however, came from the application of a new multiple suppression algorithm; reflections in general, and in particular those associated with the acoustic basement and the Moho discontinuity, were considerably improved. Gantar, C., **Ties to harbour bases for drift, scale and datum determination in antarctic marine gravity profiles,** *Bollettino di geofisica teorica ed applicata,* Mar.-June 1993, 35(137-138), Monograph on the Ross Sea Italian geophysical expeditions to Antarctica. Edited by I. Finetti and C. Roda, p.265-289, 6 refs.

Gravity reference stations have been established in the harbors of Buenos Aires, Ushuaia, Punta Arenas, Wellington, Singapore, Hobart, Dunedin and Christchurch to provide gravity reference values and to compute the calibration factor and drift rate of the marine (surface) gravity meter employed during the first 4 polar expeditions by OGS, Trieste, in the period 1987-91. The expected gravity values in Antarctica (in the southernmost part of the Ross Sea) are 2 to 3 Gal greater than gravity values of the nearest gravity comparison bases in the harbors. Therefore, scale calibration uncertainties of the order of +/- 0.3 parts per 1000, which are considered acceptable in ordinary operations, would lead to systematic errors of the order of about 1 mGal for operations in the Ross Sea, due to extrapolation of the gravity values. To solve the problem it was decided to make suitable comparisons at harbors with gravity base values spread over the largest possible range during the ship's cruise around Antarctica. (Auth. mod.)

Eittreim, S.L., **Transition from continental to oceanic crust on the Wilkes-Adelie margin of Antarctica,** *Journal of geophysical research,* Dec. 10, 1994, 99(B12), p.24,189-24,205, 48 refs.

The Wilkes-Adelie margin of East Antarctica, a passive margin rifted in the Early Cretaceous, has an unusually reflective Moho which can be traced seismically across the continent-ocean transition. Velocity models and depth sections were constructed from a combined set of U.S. and French multichannel seismic reflection lines to investigate the transition from continental to oceanic crust. These data show that the boundary between oldest oceanic crust and transitional continental crust is marked by a minimum in subsediment crustal thickness and, in places, by a shoaling of Moho. Three types of reflections in the seismic data are interpreted as volcanic deposits: high-amplitude reflections that floor the marginal rift basin, irregularly seaward dipping sequences that comprise an anomalously thick edge of oceanic crust, and highly irregular and diffractive reflections from oceanic crustal basalts that cap a normal-thickness ocean crust. The present depth to the prerift surface of continental crust is compatible with passive margin subsidence since 95 Ma, corrected for its load of synrift and postrift sediment and mechanically stretched by factors of B=1.8 or higher. (Auth. mod.)

Tréhu, A., Behrendt, J.C., Fritsch, J., **Crustal structure of the central basin, Ross Sea, Antarctica,** *Antarctic journal of the United States,* 1993, 28(5), p.89-91, 10 refs.

The authors report that this study provides them with a detailed image of the lower crust beneath an extensional basin located within a large-scale continental rift zone. Assuming that the original crustal thickness beneath the Ross Sea was 30-40 km, the authors find the crust beneath the flanks of the central basin to be uniformly stretched by a factor of 1.5-2.0. The absence of a thick, high-velocity lower crustal layer beneath the flanks of the central basin suggests that significant extension occurred with only a small amount of melt generation. The balance among crustal thinning, volume of melt added, and postrift subsidence and sedimentation was such that the final crustal thickness is found to be approximately constant.

Cunningham, W.D., Klepeis, K.A., Gose, W.A., Dalziel, I.W.D., **Patagonian orocline: new paleomagnetic data from the Andean magmatic arc in Tierra del Fuego, Chile,** *Journal of geophysical research,* Sep. 10, 1991, 96(B10), p.16,061-16,067, 44 refs.

The Hardy Formation is a 1300-m thick succession of Upper Jurassic-Lower Cretaceous volcaniclastic sedimentary rocks interbedded with lava flows on Hoste I. at the southernmost tip of South America. The strata are gently folded and metamorphosed to the prehnite-pumpellyite grade. A well-defined characteristic direction of magnetization, carried by magnetite, was readily identified in 95 samples from seven sites. It is most likely that the magnetization was acquired during the mid- to Late Cretaceous Andean orogeny that involved the folding and emplacement of the Patagonian Batholith. The fact that all samples are normally magnetized supports this age assignment. The pole position of 42.9N, 156.6E, implies that the sampling area has rotated counterclockwise relative to cratonic South America by 90.1 deg with no significant flattening of inclination (F=1.9). Geologic considerations indicate that the rotation involved the entire Andean magmatic arc in Tierra del Fuego. The results support interpretation of the Hardy Formation as part of the Andean magmatic arc deposited on the Pacific side of the Late Jurassic-Early Cretaceous Rocas Verdes marginal basin. Oroclinal bending of the arc in southernmost South America accompanied inversion of the marginal basin and the development of a Late Cretaceous-Cenozoic left-lateral transform system, South America-Antarctica, that later developed into the North Scotia Ridge. (Auth. mod.)

Davey, F.J., **Bathymetry and gravity of the Ross Sea, Antarctica,** *Terra Antartica,* 1994, 1(2), Antarctic Offshore Acoustic Stratigraphy Project (ANTOSTRAT) Symposium, Siena, 1994. Antarctic continental margin: geophysical and geological stratigraphic records of Cenozoic glaciation, paleoenvironments, and sea-level change. Extended abstracts, p.357-358, 13 refs.

The main features of the bathymetry of the Ross Sea are shown in a figure, contoured at 100 m for the shelf area and at 500 m for the continental slope. Depths are corrected for sea water velocity variations. The seafloor of the Ross Sea lies at an average depth of about 500 m and deepens towards the Ross Ice Shelf. This deep, landward dipping continental shelf is thought to result from several factors: thermal subsidence of a sediment starved margin, flexural depression caused by the large deposits of prograding sediments at the shelf edge, ice erosions of the inner shelf, and depression by the nearby ice sheet. A gravity map shows the major gravity anomalies for the Ross Sea. The anomalies are referenced to the extensive OGS Explora 1988-91 datasets which are internally very consistent. Large anomalies and steep gravity gradients lie along the Transantarctic Mountains from Ross I. to Cape Washington.

Kaminuma, K., **Seismic activity in and around the antarctic continent,** *Terra Antartica,* 1994, 1(2), Antarctic Offshore Acoustic Stratigraphy Project (ANTOSTRAT) Symposium, Siena, 1994. Antarctic continental margin: geophysical and geological stratigraphic records of Cenozoic glaciation, paleoenvironments, and sea-level change. Extended abstracts, p.423-426, 14 refs.

The antarctic continent and its surrounding southern ocean are divided into the following 5 regions in terms of seismicity: an intraplate low seismic region, high seismic region around the Antarctic Peninsula, antarctic continent aseismic region, low seismic region at the edge of the continent, and a volcanic region. A tripartite seismic array with three-component seismographs was operated around Showa Station in 1987-89 for studying the local seismicity around the station and the propagation characteristics of seismic waves under the east antarctic shield area. More than 17,000 events were recorded during 29 months from June 1987 to Oct. 1989; of these, about 25% were sea-ice shocks, 66% were icequakes, 8% were teleseisms and 1% were events caused by glacier movements. Only 10 local events were located by the network during the 20 months from June 1987 to Jan. 1989.

Broadband and wide dynamic range seismic observations with a three-component Streckeisen seismometer (STS-1V, -1H) have been carried out at Showa Station since Apr. 1989. A digital acquisition system for broadband (BRB) velocity signals was started in May 1990, providing valuable data for the study of global seismology. In this paper, the seismic observations with STS obtained by the 33rd Japanese Antarctic Research Expedition from Feb. 1992 to Jan. 1993 are presented. The current observation system, hypocentral distribution of the detected events and some examples of recorded digital waveforms are also presented. A possibility of detecting a weak long-period signal, such as that of the free oscillation of the Earth, is also mentioned in relation to the observations with the superconducting gravimeter at Showa Station which have been carried out since Mar. 1993. Hanada, H., Tsubokawa, T., **Absolute gravity measurements at Syowa Station: Results by the absolute gravimeter with a rotating vacuum pipe,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.7, Tokyo, National Institute of Polar Research, 1994, p.14-22, 8 refs.

The authors measured absolute gravity values at Showa Station, which is one of the subsets A of the International Absolute Gravity Basestation Network (IAGBN), from Dec. 28, 1992 to Feb. 5, 1993. They used an absolute gravimeter with a rotating vacuum pipe (AGRVP) together with a transportable absolute gravimeter (No.2) of the National Astronomical Observatory, Mizusawa (NAOM#2). The results of the AGRVP gave two different solutions. According to comparisons with results by other absolute gravimeters at Showa Station, the Esashi Gravity Station of National Astronomical Observatory and Gravity Station of Geographical Survey Institute, the solution with a lower value seems to the authors to be reasonable. One possible cause for the difference between the two solutions is thought to be a misalignment of the falling object. (Auth. mod.)

Kanao, M., Kamiyama, K., Ito, K., **Crustal density structure of the Mizuho Plateau, East Antarctica from gravity survey in 1992,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.7, Tokyo, National Institute of Polar Research, 1994, p.23-36, Refs. p.34-36.

Gravity measurements with a LaCoste & Romberg gravity meter were conducted on the Mizuho Plateau along the traverse routes from Showa Station to Dome F by the 33rd Japanese Antarctic Research Expedition in 1992. Free-air and simple Bouguer gravity anomalies based on gravity disturbance along the traverse routes were obtained by use of both surface elevation data from GPS positioning and bedrock elevation from radio-echo sounding. A density model of crustal structure between Showa and Mizuho stations was derived on the basis of the *P*-wave velocity model from refraction explosion experiments in 1980 and 1981. The structure of the southern part of Mizuho Station was derived from gravity anomaly data alone. The simple Bouguer gravity anomaly was calculated by assuming the layered structure to fit the observed Bouguer anomaly. An increase of the Bouguer anomaly by about -200 mgal from Showa toward the Dome area indicates crustal thickening of about 40 to 48 km. The resultant Moho depth beneath the Dome area is greater than the average depth (40-45 km) in East Antarctica. (Auth.)

Kudo, T., Nagao, T., **Evaluation of crustal structure and bedrock topography around Mizuho Plateau, Antarctica, based on gravity data,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.7, Tokyo, National Institute of Polar Research, 1994, p.37-48, 19 refs.

For the last three decades, gravity surveys around Showa Station have been conducted by the Japanese Antarctic Research Expedition. Especially in the vicinity of Mizuho Plateau, gravity data made it possible to analyze three-dimensional subsurface structures. The data have revealed several contradictions between gravity anomaly and ice thickness measured by radio echo sounding. To explain ice thickness data and gravity anomaly-bedrock height relations without any contradiction, about 5 g/

cm^3 of bedrock density is required; such high density is quite unnatural. In this study, the authors tried to construct the three-dimensional bedrock topography and shape of the Moho discontinuity by using gravity anomaly data. Through the analysis, they clarified the characteristics of the contradictions and found that ice thickness as determined by radio echo soundings is always less than the actual thickness by a constant factor. West, B.P., Sempéré, J.C., Pyle, D.G., Morgan, J.P., Christie, D.M., **Evidence for variable upper mantle temperature and crustal thickness in and near the Australian-Antarctic Discordance,** *Earth and planetary science letters,* Dec. 1994, 128(3-4), p.135-153, 43 refs.

The Southeast Indian Ridge (SEIR) in and near the Australian-Antarctic Discordance (AAD) exhibits, at a constant spreading rate, almost the full range of the many geophysical and geochemical parameters characteristic of the 'slow' Mid-Atlantic Ridge and 'fast' East Pacific Rise. Satellite-derived gravity data, in combination with SeaMARC II bathymetry in and near the AAD, were used to examine regional density variations in the upper mantle beneath the AAD. Through three-dimensional gravity analysis, it was found that at least two end-member models satisfy the gravity observations: regional crustal thickness variations of at least 3 km along the SEIR near the AAD or a temperature anomaly of the order of 150°C in the upper mantle beneath the SEIR. These new observations, combined with other geophysical and geochemical characteristics of the Australian-Antarctic Discordance, provide further evidence that the temperature structure of a mid-ocean ridge is a controlling factor, in addition to spreading rate, in the crustal accretionary process. Numerical models of mantle flow beneath mid-ocean ridges offer one means of investigating the dynamic effect of a variable upper mantle temperature on the accretionary process. Results indicate that temperature is important, especially at intermediate and slower spreading rates, where thermal effects can dominate mantle flow beneath a mid-ocean ridge and result in increasing crustal production with decreasing spreading rate. At a constant intermediate spreading rate of 37 mm/yr, characteristic of the SEIR in and near the AAD, numerical models show that significant crustal thinning (2-4 km) can occur with relatively small variations in upper mantle temperature, all else being equal. Thus, combined with end-member gravity models, these observations and results suggest that both anomalously cool upper mantle and thin crust exist beneath the AAD. (Auth. mod.)

Guterch, A., Grad, M., Janik, T., **Lithospheric structure in the region of Antarctic Peninsula from results of seismic investigations in West Antarctica,** Polar Symposium, 21st, Warsaw, Poland, Sep. 23-24, 1994. Sixty years of Polish research of Spitsbergen, edited by S.M. Zalewski, Warsaw, Polish Academy of Sciences, 1994, p.67-77, 17 refs.

During 4 Polish Antarctic Geodynamical Expeditions (1979-1991) seismic experiments were performed in the transition zone between the Drake and South Shetland microplates and the antarctic plate in West Antarctica. The interpretation yielded models of the crust and lithosphere down to 80 km depth. The crustal structure beneath the trough of Bransfield Strait is highly anomalous. This inhomogeneity was interpreted as an intrusion, coinciding with the Deception-Bridgeman volcanic line. In the study area, the Moho boundary depth ranges from 10 km beneath the South Shetland Trench to 30-33 km in the South Shetland Is., 40-45 km under the coast of the Antarctic Peninsula, and about 45 km in the region of Anvers I. In the transition zone from the Drake Passage to the South Shetland Is., a seismic boundary in the lower lithosphere occurs at a depth ranging from 35 to 80 km. The dip of this boundary (as well as the Moho boundary) is about 25°, and indicates the direction of subduction of the lithosphere of the Drake plate under the antarctic plate. (Auth. mod.)

Young, G.M., **Are Neoproterozoic glacial deposits preserved on the margins of Laurentia related to the fragmentation of two supercontinents?,** *Geology,* Feb. 1995, 23(2), p.153-156, 48 refs.

Remarkably similar deposits representing two Neoproterozoic glaciations are present on the west and east sides of Laurentia. Although now located near the margins of Laurentia, these glaciogenic successions were formed within supercontinents. The older glaciogenic succession (Rapitan-Sturtian, ca. 700 Ma) is preserved in a series of pull-apart basins formed when the supercontinent Kanatia fragmented to produce the proto-Pacific Ocean. The younger Varangerian glaciogenic rocks (ca. 600 Ma) are now scattered throughout the North Atlantic region, but formed in basins that reflect the demise of a second Neoproterozoic supercontinent (Rodinia) and heralded the formation of the Iapetus ocean. Mortimer, N., et al, **Ferrar magmatic province rocks discovered in New Zealand: implications for Mesozoic Gondwana geology,** *Geology,* Feb. 1995, 23(2), p.185-188, 20 refs.

On the basis of similar ages, major and trace element concentrations, and Sr, Nd, and Pb isotopic ratios, the Kirwans Dolerite of western New Zealand are correlated with Jurassic low-Ti tholeiites of the well-known Ferrar magmatic province of Gondwana. Field relations and preliminary paleomagnetic data also support this correlation. Although the 1 km^2 Kirwans Dolerite is the first, and so far only, Ferrar correlative to be reported from New Zealand, it considerably increases the known shape and areal extent of the Ferrar province to close to the paleo-Gondwana margin. The presence of Ferrar rocks in New Zealand can be used to test several models of Ferrar magma genesis and Gondwana regional tectonics. (Auth. mod.)

Lawver, L.A., **R/V *Nathaniel B. Palmer NBP*93-1 survey of the Antarctic Peninsula and Powell Basin,** *Antarctic journal of the United States,* 1993, 28(5), p.105-106, 3 refs.

Heat-flow, magnetics, gravity, and seismic reflection data as well as piston and gravity cores in Powell Basin were part of a study conducted on the *NBP*93-1 cruise of R/V *Nathaniel B. Palmer* to the Antarctic Peninsula. Because austral summer 1992-93 proved to be an exceptionally ice-free year for the east side of the Antarctic Peninsula, the authors took the opportunity to collect seismic, gravity, and magnetic data along the Larsen Ice Shelf to 66°45'S, an area previously unexplored. A total of 2,700 km of seismic reflection data was collected in Powell Basin. Heat-flow values indicate the general age of Powell Basin to be Oligocene. There are no correlatable magnetic anomalies from the basin, even though an extinct spreading center is identified from the seismic records.

Sloan, B.J., Lawver, L.A., **R/V *Nathaniel B. Palmer NBP*93-1 cruise to the Larsen Ice Shelf region of the Antarctic Peninsula,** *Antarctic journal of the United States,* 1993, 28(5), p.107-108, 1 ref.

During the *NBP*93-1 cruise of R/V *Nathaniel B. Palmer,* exceptional ice conditions allowed the authors to explore the Larsen Ice Shelf region south of the Antarctic Circle, which had not been previously surveyed. They collected 2,000 km of underway geophysical data on the Larsen Ice Shelf including bathymetry, magnetics, gravity, and single-channel seismic-reflection data. Examination of the nine gravity cores and two piston cores, taken along two profiles that extend from the ice shelf to the upper slope, indicated a veneer of medium-soft olive-brown diamict several centimeters thick, which is underlain by a dark gray, firm diamict unit that proved difficult to penetrate. Both units include variable fractions of sand, pebbles, and cobbles interpreted as allochthonous ice-rafted debris.

This report presents the results of geomagnetic measurements carried out at the French magnetic observatory at Dumont d'Urville during the year 1986. At Dumont d'Urville absolute measurements are made with an IPGS portable magnetometer theodolite with fluxgate sensor (X, Y, Z) and a proton precession magnetometer type GEOMETRICS G-816 (total intensity F). A three-component fluxgate variometer and a proton magnetometer are used to monitor the geomagnetic field variations. A low-power data logger (C-MOS technology) samples the field values at one-minute intervals. The data are recorded on magnetic tape or floppy disk and processed on a HP 1000 computer. Annual means, hourly means and one minute values for all the observed magnetic elements are supplied on magnetic tape and sent yearly to the World Data Centers for Geomagnetism. (Auth. mod.)

Dibble, R.R., O'Brien, B., Rowe, C.A., **Velocity structure of Mount Erebus, Antarctica, and its lava lake,** *American Geophysical Union. Antarctic research series,* 1994, Vol.66, Volcanological and environmental studies of Mount Erebus, Antarctica. Edited by P.R. Kyle, p.1-16, Refs. p.15-16.

Mount Erebus contains an active phonolite lava lake in its summit crater which erupts in a strombolian fashion randomly each day. The velocity structure of the volcano has been studied using three seismic refraction lines up to 1.4 km long, six large seismic shots, and the frequent strombolian explosions recorded by video surveillance and a 10-station seismic net. The six large seismic shots were recorded over distances of 4 to 38 km. Seismic wave arrival times limit the surface layer thickness to between 220 and 650 m and the velocities to 1.3 to 3.1 km/s. The surface layer is underlain by 5 km of massive volcanics of a velocity of 4.3 km/s and in turn is assumed to be underlain by 3-5 km of Cenozoic sediments with velocity of 4.1-5.5 km/s. The stacked seismic onsets and video explosion instants are reliable to within 0.1 s, and the earthquake foci lie within 100 m of each other. They show that the explosions occur 0.47 s before the intercept time of the seismic time/distance curve and that the apparent velocity is 4.1 km/s over the distance range 0.7 to 10 km. The refraction lines show that a seismic delay of such magnitude is not occurring on the flanks of the volcano. It must occur in and around the low-velocity lava lake, magma column, and magma chamber of the volcano. (Auth. mod.)

Dibble, R.R., **Velocity modeling in the erupting magma column of Mount Erebus, Antarctica,** *American Geophysical Union. Antarctic research series,* 1994, Vol.66, Volcanological and environmental studies of Mount Erebus, Antarctica. Edited by P.R. Kyle, p.17-33, Refs. p.32-33.

Television surveillance of explosions in the Mount Erebus lava lake has shown that explosions originate 0.5 s earlier than expected from the time-distance diagram of the accompanying earthquakes, assuming that the sources were at the explosion sites, the volcano is homogeneous, and the stacked seismograms of families of similar explosion earthquakes accurately define the seismic arrivals. Lava bombs show that the lava lake is vesicular, which markedly reduces the seismic velocity, and can cause the delay. The velocity structure in the vesicular lava column has been calculated using models of bubble growth in rising basaltic magmas with 0.5, 0.75 and 1% water and the theoretical acoustic velocity in bubbly liquids. The calculated velocities range from 20 m/s in surface magma with 50% vesicles, increasing with depth at up to 100 m/s/m to 2.3 km/s below the depth of nucleation. Ray path modeling shows that seismic rays originating in such media are curved strongly upward and have difficulty escaping into surrounding solid lava walls. (Auth. mod.)

Kaminuma, K., **Seismic activity of Mount Erebus in 1981-1990,** *American Geophysical Union. Antarctic research series,* 1994, Vol.66, Volcanological and environmental studies of Mount Erebus, Antarctica. Edited by P.R. Kyle, p.35-50, 24 refs.

The seismic activity of Mount Erebus was monitored from Dec. 1980 until Dec. 1990. Seismicity during the period can be divided into four stages: high activity (Dec. 1980 to Sep. 1982), precursor to increased explosive activity (Oct. 1982 to Aug. 1984), increased explosive activity (Sep. to Dec. 1984), and low activity (1985-1990). From Dec. 1980 to Aug. 1984, the number of volcanic earthquakes around Erebus averaged 20-150 per day, including several earthquake swarms. A marked increase in volcanic activity which began on Sep. 13, 1984 and lasted until the end of Dec. 1984 had more frequent and larger strombolian explosions. This increased eruptive activity was accompanied by a distinct decrease in the intensity of background seismic activity, and only a few earthquakes per day were subsequently recorded. The number of seismic events during 1985-1990 averaged less than 20 per day, with only one or two earthquake swarms in 1985 and 1986. An aseismic zone in the southwestern part of Erebus attenuates the higher-frequency seismic waves and might indicate a magma reservoir which continuously supplies fresh magma to the lava lake in the Erebus crater. (Auth.)

Kanao, M., Kaminuma, K., **Performance test of STS-seismograph in low temperature,** *Antarctic record,* 1994, 38(3), p.199-231, In Japanese with English summary. 26 refs.

Seismological observations by a set of three-component Streckeisen seismometers (STS-1V, -1H) have been carried out at Showa Station since Apr. 1989. Some problems have occurred during the deployment of the STS seismographs. First, there is a relationship between temperature change and the drift of POS (position) and LP (long period) outputs of STS. Second, pulse-like noises (referred to as 'shift-noises' in this paper) have been observed on the vertical component of a rapid change in temperature greater than 3°C/day or immediately after a large earthquake. In order to investigate the mechanism of occurrence of shift-noises, a simultaneous observation by two vertical sensors was conducted during JARE-33. It was revealed that the noises were generated by the behavior of the electric feedback circuit and/or of the leaf-spring of the vertical sensor under low temperature. It was found that there is a positive correlation between temperature change and drift; about 0.75 V/°C for the vertical component and 0.15 V/°C for the horizontal component. Shift noises similar to those at Showa Station were also observed in the low temperature laboratory experiment. (Auth. mod.)

Bozzo, E., Caneva, G., Capponi, G., Colla, A., **Magnetic investigations of the junction between Wilson and Bowers terranes (northern Victoria Land, Antarctica),** *Antarctic science,* June 1995, 7(2), p.149-157, Refs. p.156-157.

A magnetic survey was carried out in the area between Lady Newnes Bay and Evans Névé (northern Victoria Land) to ascertain whether the contact between the Wilson and the Bowers terranes could be identified remotely. The survey consisted of 3 ground and 12 helicopter-borne profiles. The method was calibrated on the southernmost profiles, which cover a well-exposed section of the contact between the Wilson and Bowers terranes. The magnetic data and the 2.5-D modeling of three selected profiles indicate that no easily recognizable magnetic signature defines this contact. The main features of the area are magnetic anomalies probably controlled by the "Meander Intrusives" and the McMurdo volcanic rocks, both characterized by high susceptibility values. If an anomaly related to the contact exists, then it is probably masked by these stronger anomalies. (Auth.)

Melchior, P., **Continuing discussion about the correlation of tidal gravity anomalies and heat flow densities,** *Physics of the Earth and planetary interiors,* Apr. 1995, 88(3-4), p.223-256, Refs. p.254-256.

On the basis of several objections, Rydelek et al. (hereafter denoted RZH) denied the existence of a correlation between residuals of tidal gravity (R) and heat flow (H) suggested by other workers. To re-examine the whole matter on safe grounds, the present author and his coworkers previously revised and reanalyzed all the original tidal data from 300 stations, taking care of the RZH objections by eliminating what they considered as the important sources of errors in the data, essentially calibration errors of the instruments in amplitude and phase. Using this new database, the author meets the other criticisms not related to the original tidal measurements and shows that most of them are not valid, in particular those concerning oceanic load and attraction corrections. A critical examination of the tides in the antarctic shows that the tidal residues observed at Amundsen-Scott Station are not due to imperfections in the world Schwiderski maps but rather to tides of the Ross and Ronne Ice Shelves which are not included in the Schwiderski maps. (Auth. mod.)

Reitmayr, G., **Gravity map of Victoria Land, Antarctica,** *Terra Antartica,* 1994, 1(3), Special issue: Lithospheric Investigations in the Ross Sea Area (LIRA) Workshop, Gradisca d'Isonzo, June 3-5, 1993. Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Meeting, Gradisca d'Isonzo, May 31-June 2, 1993. Antarctic Crustal Profile (ACRUP). Data report. Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94). Edited by C.A. Ricci, p.495-500, 14 refs.

More than 1,300 records of land gravity data, gathered during a series of expeditions to Victoria Land, in particular during the last four German GANOVEX expeditions, have been used to produce Free Air and Bouguer maps of this area. In addition to the conventional gravity corrections, the effects of ice cover had to be considered. Model calculations show that most of the lateral changes measured can be well explained by known details of topography and ice cover. Underneath the large glaciers, however, sea water or sedimentary troughs of substantial dimensions have to be assumed. (Auth.)

Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Meeting, Gradisca d'Isonzo, May 31-June 2, 1993. Antarctic Crustal Profile (ACRUP). Data report. Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94). Edited by C.A. Ricci, p.503-506, 13 refs.

Airborne investigations of the magnetic field in the Ross Sea region have been carried out since about 1960. During the last ten years about 90,000 km of data have been gathered at line spacings of 4.4 km (in most cases) with a tie-line interval of 22 km. Major structures in the Ross Embayment, such as the Victoria Land Basin and its central graben structure, have been magnetically identified and their extent determined. New features, e.g. the Polar 3 anomaly, have been discovered and are discussed in the context of the tectonic evolution in the Ross Sea area. Units of distinct magnetic signature and magnetic lineaments contributed to the understanding of the crustal structure of parts of the Ross Embayment. However, open questions remain regarding the boundary of the West Antarctic Rift System with the East Antarctic shield. (Auth. mod.)

Ricci, p.509-511, 19 refs.

Geophysical surveys over and adjacent to the Ross Sea continental shelf have revealed much information about the structure of the extended crust in this area of the volcanically active West Antarctic rift system (WR). The areas of the rift underlying the Byrd Subglacial basin are much less well known. Late Cenozoic rift activity, characterized by exposures of alkaline bimodal volcanic rocks along the flanks of the WR, has been dated from about 30 Ma to the present. A large mantle-plume-head origin has been proposed for the late Cenozoic rift activity in the WR on the basis of geophysical data and of ocean island basalt chemistry of the volcanic rocks.

Delisle, G., **Measurement of terrestrial heat flow in glaciated terrain (preliminary data from Victoria Land, Antarctica),** *Terra Antartica,* 1994, 1(3), Special issue: Lithospheric Investigations in the Ross Sea Area (LIRA) Workshop, Gradisca d'Isonzo, June 3-5, 1993. Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Meeting, Gradisca d'Isonzo, May 31-June 2, 1993. Antarctic Crustal Profile (ACRUP). Data report. Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94). Edited by C.A. Ricci, p.527-528, 13 refs.

Heat flow measurements in the Ross Sea have shown consistently high values. The East Antarctic craton, on the other hand, is generally believed to be characterized by low heat flow values. The determination of the increase of terrestrial heat flow in the transitional zone between this craton and the Ross Sea could potentially help answer the two closely connected questions of the effect of the evolution of high crustal temperatures of the Western Ross Sea on the adjacent continental crust and of the cause of the ongoing uplift of the Transantarctic Mountains. An attempt to measure terrestrial heat flow in the onshore transitional zone was carried out during GANOVEX VII and is discussed in this paper.

Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Meeting, Gradisca d'Isonzo, May 31-June 2, 1993. Antarctic Crustal Profile (ACRUP). Data report. Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94). Edited by C.A. Ricci, p.529-530, 8 refs.

Evaluation of the heat flow density (HFD) in glaciated terrains or in marine areas by means of temperature and thermal conductivity measurements at shallow depth is difficult because of the rapidly changing boundary conditions at the surface. The first HFD determination in the Ross Sea area was performed on Ross I. in a shallow borehole at Arrival Heights, about 2 km north of McMurdo Station. The estimated heat flux value is 164±60 mW/m^2, or about three times the normal value. The HFD data set is heterogeneous and can only be used qualitatively for tectonic interpretation.

Morelli, A., Amato, A., **Seismological contributions to a better knowledge of deep crustal and upper mantle structure beneath Antarctica,** *Terra Antartica,* 1994, 1(3), Special issue: Lithospheric Investigations in the Ross Sea Area (LIRA) Workshop, Gradisca d'Isonzo, June 3-5, 1993. Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Meeting, Gradisca d'Isonzo, May 31-June 2, 1993. Antarctic Crustal Profile (ACRUP). Data report. Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94). Edited by C.A. Ricci, p.531-532, 11 refs.

Seismological studies can provide unique information about the structure of the deep crust and upper mantle. The authors review three essentially different methods characterized by the use of different data and by different scales of application. Structural heterogeneities, such as those due to subducted slabs, continental roots, or thermal anomalies below rift or volcanic areas, induce anomalies in the velocity of seismic waves. These anomalies can be imaged using teleseismic recordings from an appropriate seismograph network. Tomographic techniques presented in the last 15 years or so have allowed identification of heterogeneities in the crust or in the upper mantle to a detail which varies with the general dimensions and density of the network.

Conti, C.M., Rapalini, A.E., Vilas, J.F., **Palaeomagnetism of the Silurian Lipeón formation, NW Argentina, and the Gondwana apparent polar wander path,** *Geophysical journal international,* June 1995, 121(3), p.848-862, 69 refs.

A palaeomagnetic study was carried out on ferriferous beds of the Early Silurian Lipeón Formation in NW Argentina. Samples were collected at 19 sites in four different localities. Detailed thermal demagnetization has permitted the identification of three different magnetic components. All components are carried by haematite, as deduced from IRM curves and microscope analyses. Component A is interpreted to be of Recent origin, due to its coincidence with the geomagnetic dipole direction and its association with post-diagenetic platy haematite. Component B, with exclusive positive inclinations, was found in two out of four sampling localities. Its possible significance is discussed on the basis of an indeterminate result of the fold test and its correlation with the degree of deformation in the samples. The third isolated component (C) was present in the other two localities. It passed both fold and reversal tests and is clearly associated with oolitic haematite of early diagenetic origin. A palaeomagnetic pole of possible Early Silurian age was computed on the basis of mean site directions of component C. This new pole implies lower latitudes for Gondwana in the Silurian than were previously proposed and suggests a modification of the Gondwana apparent polar wander path. A reversed polarity option for the Early-Middle Palaeozoic path is suggested as a possible alternative. (Auth. mod.)

Yao, B.C., Wang, G.Y., Chen, B.Y., Chen, S.Y., **Characteristics of geophysical field and tectonical evolution in the Bransfield Strait,** *Antarctic Research (Chinese edition),* Mar. 1995, 7(1), p.25-35, In Chinese with English summary. Refs. p.34-35.

Analysis of data collected in Bransfield Strait in 1991 is presented. The geomorphology, gravity and magnetic anomalies trend (NE direction) are recognized as bandings. The sediments in the Bransfield Strait are subdivided into two sequences: first rifting sequence and second rifting sequence. The basement is faulted into a half-graben faulting on the northwestern side of the Bransfield trough. Considering the crustal structure crossing the South Shetland Is., Bransfield Strait and the Antarctic Peninsula, the authors propose a two-phase rifting tectonic evolution model and a layered-shear model for the lithospheric deformation under the extensional stress field. (Auth.)

Canals, M., et al, **Results of GEBRA '93 investigations in the Central Bransfield Basin** [La Cuenca Central de Bransfield (NW de la Península Antártica): primeros resultados de la campaña GEBRA '93], *Geogaceta,* Dec. 1994, No.16, p.122-125, In Spanish with English summary. 14 refs.

The GEBRA '93 (Geological Evolution of the Bransfield Basin) survey was carried out in Dec. 1993 in the Bransfield Strait and adjacent areas, on board the *BIO Hespérides.* The geophysical data acquired helped characterize the morphostructure, sediment cover and magnetic anomalies of the SW-NE trending Central Bransfield Basin. Some traverse shifts and thresholds, together with volcanic alignments along the basin, complicate the morphology and seismic structure of what otherwise would have been a long, continuous axial trough opened on a crust under extension. A major submarine valley has also been identified and named Gebra Valley. (Auth.)

Scotese, C.R., Barrett, S.F., **Gondwana's movement over the South Pole during the Palaeozoic: evidence from lithological indicators of climate,** *Geological Society of London. Memoirs,* 1990, No.12, Palaeozoic palaeogeography and biogeography. Edited by W.S. McKerrow et al, p.75-85, 49 refs.

DLC QE501.4.P3 P27

A statistical technique is described that uses the geographical distribution of lithological indicators of climate (carbonates, evaporites, coals and tillites) to estimate the past position of the geographic pole. This technique was used to estimate the movement of the South Pole across the supercontinent of Gondwana during the Palaeozoic. Results indicate that during the Cambrian and Early Ordovician the South Pole was located adjacent to northwestern Africa. The pole moved into the Amazon Basin during the Late Ordovician and into south-central Argentina during the Silurian. Throughout the Devonian and Early Carboniferous the pole moved slowly from a location in southern Argentina to a position near the south coast of Africa. From the Late Carboniferous and into the Permian the South Pole swung eastward across central Antarctica. The Early Palaeozoic and Late Palaeozoic portions of the palaeoclimatically determined APW (apparent polar wander) path are in good agreement with available palaeomagnetic data. The Middle Palaeozoic portion of the palaeoclimatically determined APW path agrees better with the palaeomagnetic data that places the South Pole in southern Argentina, than with the palaeomagnetic results that place the Devonian pole in central Africa. Grunow, A.M., **Implications for Gondwana of new Ordovician**

paleomagnetic data from igneous rocks in southern Victoria Land, East Antarctica, *Journal of geophysical research,* July 10, 1995, 100(B7), p.12,589-12,603, 67 refs.

New paleomagnetic data presented here from the southern Victoria Land (SVL) region of East Antarctica further refine the Gondwana early Paleozoic apparent polar wander path. The results are based on paleomagnetic analyses of Early to Middle Ordovician granitoids and dike swarms from which a new SVL pole was calculated. The new SVL paleomagnetic pole agrees with less well-determined Ordovician poles from other parts of East Antarctica, indicating little or no translation/rotation across the East Antarctic craton since the Middle Ordovician. The new Gondwana 515 Ma and 475 Ma poles, when compared with poles of similar age from Laurentia, allow paleogeographic reconstructions to be made that are in keeping with models predicting that Iapetus Ocean basin opening and closure may have been related first to rifting and then collision of Laurentia with Gondwana. The paleomagnetic data also suggest that most of West Gondwana moved toward lower latitudes between the Middle/Late Cambrian and the late Early Ordovician, which may be reflected in the fossil record. Shibuya, K., Dibble, R.R., Baba, M., Kyle, P.R., **Classification of volcanic earthquakes at Mount Erebus, Antarctica,** IAVCEI proceedings in volcanology. 1. Volcanic hazards: assessment and monitoring, edited by J.H. Latter, Berlin, Springer-Verlag, 1989, p.520-535, 13 refs.

DLC QE527.5.V65

On the basis of infrasonic and seismic waveforms, the authors classify volcanic earthquakes at Erebus volcano into Group I events accompanied by infrasonic signals of eruptions, and Group II without eruption signals. Groups I and II are connected by a hybrid type, which has a seismic signal of tremor type, and an infrasonic signal of β-type. Hence, there must be a transition in the generating mechanism from β- to hybrid to tremor type. Considering all types together, the dominant seismic frequency increases in a general way with reported focal depth, and a similar increase in the spectrum of the source time function is postulated. (Auth. mod.)

Dibble, R.R., **Infrasonic recordings of Strombolian eruptions of Erebus, Antarctica, March-December 1984, covering the jump in activity on 13 September 1984,** IAVCEI proceedings in volcanology. 1. Volcanic hazards: assessment and monitoring, edited by J.H. Latter, Berlin, Springer-Verlag, 1989, p.536-553, 21 refs.

DLC QE527.5.V65

Continuous infrasonic recordings made at Windless Bight, 26 km from the summit crater of Erebus between Mar. and Dec. 1984, show an abrupt change both in the average interval between explosions and in the maximum infrasonic amplitudes on Sep. 13. Before the change the average interval was 2.8 days, and the maximum infrasonic amplitude was 6.3 mbar peak; afterwards the average interval was about 1.5 h, and the maximum amplitude on Sep. 17 was 32 mbar peak. From Sep. 13 to Dec. 8, when activity ceased for 13 days, about 1000 explosions occurred. The study demonstrates that independent monitoring of explosive eruptions by infrasonic arrays can determine explosion energy and minimum estimates of erupted gas volumes at nearby volcanoes. The other unique advantage is a superior far-field detection ability which offers the greatest potential for systematically reporting volcanic explosion energy worldwide. (Auth. mod.)

Velasco, A.A., Ammon, C.J., Lay, T., **Source time function complexity of the great 1989 Macquarie Ridge earthquake,** *Journal of geophysical research,* Mar. 10, 1995, 100(B3), p.3,989-4,009, 45 refs.

The rupture process of the great 1989 Macquarie Ridge (M_w=8.1) strike-slip faulting earthquake is examined using an empirical Green function deconvolution method which provides broadband source time functions from both body and surface waves. Body wave deconvolutions indicate that the principal short-period (<30 s) moment release occurred in the first 25 s of rupture with no resolvable directivity; only minor short-period energy release occurred over the next 30 s. Surface wave deconvolutions for the usually neglected 20-150 s period range produce source time functions with slightly larger total moment than the body wave deconvolutions and no resolvable directivity from the onset to the peak of moment release in the first 20 s. Spectral inversions of long-period Love and Rayleigh waves indicate a centroid time shift of approximately 25 s in the period range of 150-280 s, compatible with the deconvolved surface wave source time functions. Deconvolutions using both empirical and theoretical Green functions are optimized to detect any long-period precursory radiation for periods up to about 250 s, but no convincing evidence for precursory radiation in the passband is found. Henry, B., Plessard, C., **Geodynamical implications of new paleomagnetic data from Kerguelen Is.** [Implications géodynamiques de nouvelles données paléomagnétiques des îles Kerguelen (Océan Indien, France)], *Académie des sciences, Paris. Comptes rendus. Série II,* June 15, 1995, 320(12), p.1159-1162, In French with English summary. 21 refs.

A first significant palaeomagnetic pole for the Lower Miocene (22-20 Ma) of the Kerguelen Is. has been determined using data from 46 basaltic lava flows: 153.6°E, 84.2°N, A95=6.3°K=10.9. Since this period, the Kerguelen Is. have undergone clockwise rotation of about 10°. This rotation is related to drift of the whole of the stable Antarctica whose absolute position during Lower Miocene is now better defined. (Auth.)

Storey, B.C., **Role of mantle plumes in continental breakup: case histories from Gondwanaland,** *Nature,* Sep. 28, 1995, 377(6547), p.301-308, 90 refs.

After thirty years of plate-tectonic theory, the reasons why supercontinents disintegrate and disperse to form smaller continental plates remain enigmatic. Possible causes range from abnormally hot mantle upwellings, or plumes, to changes in plate-boundary driving forces. The breakup of the Gondwanaland supercontinent, which started about 180 m.y.a., provides an excellent case history against which to test models. (Auth.)

Lanyon, R., Crawford, A.J., Eggins, S.M., **Westward migration of Pacific Ocean upper mantle into the southern ocean region between Australia and Antarctica,** *Geology,* June 1995, 23(6), p.511-514, 26 refs.

The southern ocean south of the Great Australian Bight hosts a globally anomalous region of mid-ocean ridge, the Australian-Antarctic Discordance. In addition to its recognized morphological and geophysical anomalies, the discordance represents the current on-axis location of a proposed isotopic boundary between Indian Ocean and Pacific Ocean upper mantle convective regimes, previously defined from analyses of ≤4 Ma mid-ocean ridge basalts (MORB). Pb, Sr, and Nd isotope analyses of ca. 36-66 Ma seafloor dredged from either side of the northward extrapolation of the Australian-Antarctic Discordance show that ≥36 Ma seafloor to the east has an Indian Ocean MORB isotopic signature. This indicates that the Indian-Pacific isotopic boundary does not extend directly north of the ridge toward the southern margin of Australia. Progressive westward migration of an arcuate-shaped front of Pacific Ocean upper mantle therefore appears to be a consequence of Australian-Antarctic rifting and southern ocean opening, suggesting that the current location of the isotopic boundary within the discordance may be entirely coincidental. Small, C., **Observations of ridge-hotspot interactions in the southern ocean,** *Journal of geophysical research,* Sep. 10, 1995, 100(B9), p.17,931-17,946, 78 refs.

In this investigation, satellite-derived marine gravity data are used in conjunction with underway bathymetric and magnetic anomaly profiles to investigate the nature of ridge-hotspot interaction at four sparsely explored systems in the southern ocean. These systems illustrate three different stages of ridge-hotspot interaction in which a migrating spreading center approaches a hotspot (Pacific-Antarctic/Louisville), passes over or is captured by the hotspot (Mid-Atlantic/Shona-Discovery), and ultimately migrates away from the hotspot (Southeast Indian/Kerguelen). All of these systems show some evidence of discrete ridge jumps in the direction of the hotspot as the spreading center attempts to relocate toward the hotspot by asymmetric spreading. A simple model predicts that typical plume excess temperatures can weaken the lithosphere sufficiently to promote asymmetric spreading and possibly allow a discrete ridge jump. (Auth. mod.)

Behrendt, J.C., McCafferty, A.E., Damaske, D., Kyle, P.R., **High amplitude aeromagnetic anomaly over the Butcher Ridge igneous complex: evidence of possible Jurassic cumulate rocks in the Transantarctic Mountains bordering the Ross Embayment,** *American Geophysical Union. Antarctic research series,* 1995, 67(4), Contributions to antarctic research IV, p.1-7, 21 refs.

DLC G845.C67 vol.67, no.4, 1995

A high amplitude magnetic anomaly occurs over the Butcher Ridge igneous complex in the Transantarctic Mountains. This sill-like body is approximately 10 km long where exposed. It ranges from basalt to rhyolite in composition and has been suggested as evidence of a large mafic intrusion at depth. A single NW-SE aeromagnetic profile flown across Butcher Ridge gave an 8-km wide positive anomaly with maxima of about 700 and 1000 nT which are associated with topographic peaks that the aircraft cleared at about 300 and 600 m respectively. The observed amplitude of the Butcher Ridge anomaly is too great to be caused by a typical sill of Ferrar Dolerite, examples of which are widely exposed along the Transantarctic Mountains. Model calculations show that the upper and most magnetic part of the inferred intrusion must be greater than about 2 km thick and that the entire intrusion is probably substantially thicker. The source of the Butcher Ridge magnetic anomaly is interpreted to be a layered mafic intrusion, syntectonic with the Jurassic Transantarctic (failed) rift, marked by the Ferrar Dolerite. Hotten, R., **Palaeomagnetic studies on mafic dykes of the Shackleton Range, Antarctica, and their geotectonic relevance,** *Polarforschung,* 1995(Pub. 1993), 63(2/3), p.123-151, With German summary. 62 refs.

During the Geological Expedition to the Shackleton Range, Antarctica (GEISHA) in 1987-88, samples were taken from twenty-one basaltic dykes for palaeomagnetic investigations. The directions of characteristic remanent magnetization (ChRM) of the dykes were determined by thermal and alternating-field demagnetization of 268 cores drilled from the specimens collected. Moreover, on account of the hydrothermal and sometimes low-grade metamorphism of the dyke rock and the resulting partial modification of the primary magnetization, not only were comprehensive magnetic studies carried out, but also ore-microscopic examination. Jurassic and Silurian-Devonian ages were confirmed for the dykes of the northern and northwestern Shackleton Range. Radiometric ages were also determined for some of the dykes. Conclusions on the geotectonic relations of the Shackleton Range can also be drawn from the palaeomagnetic data. The pole positions for the Shackleton Range agree with those of rocks of the same age from other areas of East Antarctica. Its positions in the Palaeozoic-Mesozoic polar-wandering path for Gondwana are evidence against the idea of rotation and suggest rather that the position of the Shackleton Range crustal block is autochthonous. (Auth. mod.)

Warner, R.D., Wasilewski, P.J., **Magnetic petrology of lower crust and upper mantle xenoliths from McMurdo Sound, Antarctica,** *Tectonophysics,* Sep. 15, 1995, 249(1-2), p.69-92, Refs. p.91-92.

A suite of xenoliths was collected from Ross I. in the McMurdo Sound area. The purpose of the study of these xenoliths was to determine the level of magnetization in lower crust and upper mantle lithologies and to discover the mineralogical basis for the magnetization records. Results show that the high geothermal gradient, characteristic of a continental rift setting, argues for about 12 km of magnetic crust before the Curie point is exceeded. The primary oxide of consequence in this rift environment appears to be ilmenite, which may be a common lower crust oxide mineral in this type of tectonic setting. No evidence was found in thermomagnetic experiments or in petrographic studies to suggest the presence of native iron. The secondary origin of much of the titanomagnetite now present suggests that unaltered, *in-situ* granulite lower crust in this area would be weakly magnetic even in a situation where the geothermal gradient was lower or where a tectonic reconfiguration would render the lower crust above the Curie geotherm. (Auth. mod.)

Heap, J.A., ed, **Handbook of the Antarctic Treaty System. Eighth edition,** Washington, D.C., U.S. Department of State, 1994, 2300p.

This Handbook reproduces material related to the complex of arrangements comprising the Antarctic Treaty system, that is to say, the Antarctic Treaty itself, the Protocol on Environmental Protection to the Antarctic Treaty, 'measures (recommendations) in furtherance of the principles and objectives of the Treaty', and separate instruments dealing with seals and living resources. This edition of the Handbook has been rearranged to reflect the adoption and opening for signature in Madrid on Oct. 4, 1991 of the Protocol on Environmental Protection to the Antarctic Treaty. Part 1 contains General Measures relating to the operation of the Antarctic Treaty system, inspections under Treaty, exchanges of information and facilitation of scientific cooperation, as well as other components of the system covering the conservation of seals and other marine living resources and sections dealing with SCAR and COMNAP. It also includes material on the regulation of antarctic mineral resource activities. Although the Convection on that subject is not now likely to enter into force, it provides a number of precedents for later developments in the system. Part 2 contains material relating to the protection of the environment, including the Protocol and its five annexes. (Auth. mod.)

Zou, K.Y., **China's antarctic policy and the Antarctic Treaty System,** *Ocean development and international law,* July-Sep. 1993, 24(3), p.237-255, 101 refs.

China began to express its interest in Antarctica in the early 1980s. China acceded to the Antarctic Treaty in 1983 and obtained consultative party status within the Antarctic Treaty System (ATS) two years later. Since 1984, China has been sending national scientific expeditions annually to the white continent and the surrounding seas. This article analyzes China's interests in and policy toward Antarctica as a whole by first discussing China's activities in Antarctica, its approaches to the Antarctic Treaty and its role in the ATS. It then explores the future trend of China's antarctic policy from political, economic, scientific, and environmental perspectives. The article concludes that with China's involvement in antarctic affairs, the vitality of the ATS has been further strengthened and Antarctica can better serve the interest of all mankind. (Auth.)

Blay, S.K.N., **New trends in the protection of the antarctic environment: the 1991 Madrid Protocol,** *American journal of international law,* Apr. 1992, 86(2), p.377-399, 78 refs.

The Protocol on Environmental Protection to the Antarctic Treaty (Madrid Protocol) was approved in June 1991 and constitutes the most comprehensive treaty ever adopted on international environmental protection. The Madrid Protocol originated in the 1988 Convention for the Regulation of Antarctic Mineral Resource Activities (CRAMRA). CRAMRA was opposed by some governments because it permitted mining; the Madrid Protocol's ban on mining in Antarctica is the main difference between the two.

Korotkevich, E.S., Slevich, S.V., Rogovtsev, A.N., **Antarctica as a nature reserve,** *Polar geography and geology,* Jan.-Mar. 1993, 17(1), p.79-84, Translated from Russkoe geograficheskoe obshchestvo. Izvestiia, Vol.124, No.3, 1992. 6 refs.

In terms of its ecology, the antarctic continent is unique. Perhaps the most crucial aspect is the delicate equilibrium existing among the flora, fauna, and the physical environment, an equilibrium which is extremely vulnerable to uncontrolled exploitation. Starting with the signing of the Antarctic Treaty in Dec. 1959, the authors trace the sequence of measures taken to safeguard the delicately balanced antarctic environment. They conclude that the signing of the Protocol on the Protection of the Environment in Madrid in 1991, which established a 50-year moratorium on mineral exploration or development, has made Antarctica the largest nature preserve in the world. Polar Research Board. Committee on Antarctic Policy and Science, **Science and stewardship in the Antarctic,** Washington, D.C., National Academy Press, 1993, 107p., Refs. p.85-86.
DLC G877.S35

At the request of the U.S. Department of State, the Polar Research Board of the National Research Council (NRC) established a Committee on Antarctic Policy and Science (CAPS) to evaluate the possible impacts of policy decisions on scientific programs in Antarctica. Following its initial meeting in 1992, the Committee convened a workshop to examine the governmental, environmental, and scientific issues raised by the Protocol. This report is the result of the Committee's deliberations; it consists of 5 chapters and 2 appendixes. The objectives of the report are: to outline the role of science in the stewardship of the Antarctic, and to describe the nature and characteristics of the governance process for the United States that will enable scientific investigations to contribute to that stewardship effectively. An Appendix considers tourism and includes guidelines for tourist conduct.

Scapple, K., **Do international environmental policies really protect the environment? A framework for analyzing treaties,** Columbus, Ohio State University, 1994, 191p., University Microfilms order No. 94-27782, Ph.D. thesis. Refs. p.167-191.

A definition of environmental protection is created based on both contemporary and classical literature. This definition is used to analyze two international environmental treaties: the Montreal Protocol on Substances That Deplete the Ozone Layer, and the Convention for the Conservation of Antarctic Seals. The hypothesis is that a thorough treaty-making process tends to lead to higher levels of environmental protection. An analysis of the two cases indicates that there are challenges to this hypothesis. Organizations with global goals do not always draft treaties with higher levels of environmental protection. In fact, the participation of nongovernmental organizations may not always lead to high levels of environmental protection. In addition, an executive head with strong environmental commitments may not be necessary to the creation of good environmental policy. Rather, it appears that higher levels of environmental protection can be reached when the actors agree on both the problem and solution representations. The dissertation suggests that the two case studies did provide a good test of the analytical framework, but that additional case studies are warranted so that the hypotheses generated in this project can be tested. Stokke, O.S., **Domestic politics and non-state actors in the Antarctic Treaty System: towards a framework,** *Fridtjof Nansen Institute. International Antarctic Regime Project. IARP publication series,* 1992, No.1, 19p., Refs. p.17-19.

The most important properties (variables) of domestic policy processes affecting antarctic politics are identified considering three levels of interaction: the domestic process of societal organizations trying to influence the foreign policy of a number of key antarctic states; the international process of these states grappling with the antarctic challenges; and the transnational process of societal organizations strengthening their ties to sister organizations in other countries to maximize their influence on the international deliberations of the Antarctic Treaty System. Seven steps are proposed to organize the analysis of environmental issues on the antarctic agenda.

Joyner, C.C., **Role of domestic politics in making United States antarctic policy,** *Fridtjof Nansen Institute. International Antarctic Regime Project. IARP publication series,* 1992, No.2, 23p., 72 refs.

The main portion of this paper treats the general nature of domestic political influences on antarctic policy-making in the United States. A conceptual taxonomy for these chief domestic political forces is set out and the forces are assessed. The next substantive section examines the formulation and implementation of antarctic policy in the U.S. government. The roles of the executive and legislative branches, as well as various agencies in the U.S. government responsible for antarctic policy-making, are identified and analyzed, and organizational models depicting the U.S. antarctic policy-making process are suggested. A number of points about the domestic sources of U.S. antarctic policy are identified for critical reflection.

Orrego Vicuña, F., **Protection of the antarctic environment,** *Fridtjof Nansen Institute. International Antarctic Regime Project. IARP publication series,* 1992, No.5, 44p., Refs. and notes p.30-44.

From the simplicity of the first recommendations of the Antarctic Treaty Consultative Parties relating to the impact of man on the antarctic environment, followed by the more specific problem of oil pollution, and arriving at current complex regimes for protection, a gradual extension of protection systems, and a significant development of its subject matter, is noted. This study emphasizes the main aspects of this evolution within the Antarctic Treaty, as well as the environmental criteria incorporated into resource regimes and into the preparation of comprehensive measures for environmental protection.

M-53228
Mielke, J.E., **Antarctic mineral resource activities: regulate or prohibit?,** *CRS review,* Nov.-Dec. 1990, 11(11-12), p.22-24.

Considering that Antarctica is under increasing scrutiny as a potential source of mineral resources, the author reviews this issue in the Antarctic Treaty framework and examines the likelihood of mineral deposits in Antarctica. A brief reference to the U.S. Congress action on the subject is made.

DLC KWX705.I57

This volume contains 12 papers, 6 of which were produced in a workshop on the legal issues involved in the protection of the antarctic environment, organized by the International Peace Studies Center of the University of Siena in 1990. The other 6 papers, prepared shortly after the adoption of the Madrid Protocol, consider the substantive and procedural norms introduced by the Protocol and its annexes and try to assess their impact on the Antarctic Treaty System and its relations with the body of international environmental law.

Francioni, F., **Madrid Protocol on the protection of the antarctic environment,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.1-30, 42 refs.

DLC KWX705.I57

An outline is presented of the various approaches to the environmental protection issue, debated in the course of several sessions of negotiations resulting in the adoption of the Madrid Protocol in 1991. An appraisal is made of the significance, efficacy and shortcomings of the norms contained in the Protocol, their relationship with the Antarctic Treaty System and the general principles of international law on the protection and conservation of areas not subject to the sovereignty of any nation.

M-53293
Watts, A., **Present antarctic system of environmental protection,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.31-52, 30 refs.

DLC KWX705.I57

The legal framework for the protection of the antarctic environment is evaluated in the light of the provisions of the Antarctic Treaty, CCAS, CCAMLR, CRAMRA, and a review of non-antarctic treaties. It is found that the legal framework contains adequate mechanisms for securing improvements as and when they are needed; it is for governments to decide how and when to make use of these mechanisms.

M-53294
Manzoni, M., **Environmental hazards in Antarctica and man's impact on the antarctic environment,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.53-92, 21 refs. and notes.

DLC KWX705.I57

The discussion addresses the question of the hostility of the antarctic nature to man and why antarctic nature needs protection. The impact of human activities in Antarctica is examined, including chemical, biological and radioactive contamination, exploitation of living resources and possible impact of mineral exploitation. The prerequisites for environmental protection are described and measures for its implementation, such as the EIA measures in the Antarctic Treaty System and those in the Madrid Protocol, are reviewed.

M-53295
Sohn, L.B., **Alternative strategies for the protection of the Antarctic,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.93-112, 44 refs.
DLC KWX705.I57

The Antarctic Treaty provisions relevant to the protection of the antarctic environment are reviewed, and the related agreements and contentions of the Consultative Parties, expressed during the UN General Assembly sessions and at various international conferences, are discussed. The provisions of the CRAMRA document resulting from the Wellington Conference of 1988 are examined. Step-by-step recommendations are made to improve cooperation on environmental issues between the United Nations and the Antarctic Treaty Consultative Parties.

M-53296
Scovazzi, T., **Application of the Antarctic Treaty System to the protection of the antarctic marine environment,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.113-134, 56 refs.
DLC KWX705.I57

A survey is made of the provisions of the present Antarctic Treaty System which are applicable to the protection of the antarctic marine environment, including the Antarctic Treaty, CCAS, CCAMLR, CRAMRA, and the Madrid Protocol. Recommendations of the Antarctic Treaty Consultative Parties regarding disposal of waste at sea, pollution from ships or from mining activities, and conservation of special areas are reviewed. In the concluding remarks, the Madrid Protocol is commended for being an instrument which deals extensively with the prevention of pollution of the antarctic ocean.

M-53297
Infante, M.T., **Applicability of maritime conventions to Antarctica,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.135-148, 18 refs.
DLC KWX705.I57

To examine the applicability of the maritime conventions to the Antarctic Treaty area, a theoretical analysis is made of the main points of the Treaty and the law of the sea, with a general reference to the UN Convention of 1982. The analysis includes a discussion on the antarctic regime and the law of the sea, a review of old concepts and new realities in the law of the sea applicable to Antarctica, and the impact of the 1991 Madrid Protocol on marine environmental issues.

Scovazzi, T., Pineschi, L., **Environmental impact assessment for scientific and logistic activities in Antarctica,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.149-173, 46 refs.
DLC KWX705.I57

After providing a definition of the concept "environmental impact assessment" (EIA), an introduction of *ad hoc* regulations for EIA in Antarctica is made. The rules of the Antarctic Treaty System are presented in the light of the Antarctic Treaty Consultative Parties recommendations and the articles of the Madrid Protocol. A short survey of EIA procedures followed by nations active in Antarctica includes Argentina, Chile, Australia, Germany, France, Italy, New Zealand, Norway, the United Kingdom, and the United States.

M-53299
Pineschi, L., **Tourist activities and the protection of the antarctic environment: current obligations and possible future developments,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.175-202, 87 refs.
DLC KWX705.I57

Reasons for concern about tourist activities in Antarctica, and the position of the ATCP on that issue reflected in their recommendations on regulating tourist activities, are discussed. The present legal regime, according to the Antarctic Treaty Recommendations, excludes tourists from Specially Protected Areas, the Specially Reserved Areas, and some new islands; certain restrictions are applied to marine areas. The new obligations provided for by the Madrid Protocol and its related annexes regarding tourism are examined, including prior environmental impact assessments, the assessment of impact on flora and fauna, waste management and disposal, prevention of marine pollution, and control. In the concluding discussion, some suggestions are made toward controlling tourism based on already existing regulations in other areas of environmental protection.

M-53300
Colella, A., **Legal nature of Antarctic Recommendations and their implementation in the domestic legal systems,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.203-223, 41 refs.
DLC KWX705.I57

It is argued that the effectiveness of the measures established by the ATCP to protect the antarctic environment and regulate the impact of human activities largely depends on the legal strength of the Recommendations. To that end, the legal nature, or status, of the measures enacted by the Consultative Meetings of the Antarctic Treaty in pursuance of Article IX of the 1959 Treaty is defined, and the procedure by which the Antarctic Recommendations are implemented in the domestic legal systems of the Contracting Parties is examined. It is concluded that some countries consider the Recommendations merely as such, in that they express only a moral guideline and not a normative standard.

M-53301
Conforti, B., **Direct applicability in domestic law of recommendations adopted under Art. IX of the Antarctic Treaty: some comparative remarks,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.225-231, 13 refs.
DLC KWX705.I57

An interpretation is proposed of the reasons why many nations, having ratified the Antarctic Treaty and given it validity within their legal systems, believe that the recommendations of Article IX of the Treaty could not become directly applicable without a legislative or administrative act to incorporate them into domestic law.

M-53302
Francioni, F., **International responsibility for damage to the antarctic environment,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.233-257, 53 refs.
DLC KWX705.I57

This paper focuses on several legal issues related to the practical implementation of international responsibility for environmental damage in Antarctica. The discussion includes sources of environmental hazards, the applicability of a system of responsibility for environmental harm, conditions and standards of responsibility, and nature and scope of damage to the environment. The final question considers who may legitimately take unilateral or collective action to enforce responsibility for environmental damage in Antarctica.

M-53303
Sciso, E., **Are mineral resource activities still compatible with the protection of the antarctic environment?,** International environmental law for Antarctica, edited by F. Francioni, Milan, Giuffrè Editore, 1992, p.259-282, 44 refs.
DLC KWX705.I57

Two conflicting objectives, the exploitation of antarctic mineral resources and the protection and preservation of the environment, are examined in the light of the standards of environmental protection established by the 1988 Wellington Convention. It is concluded that, should the Convention become a valid regime for future mineral activities in Antarctica, it would be an inadequate legal regime if the objective of environmental protection is to be achieved.

M-53330
Angelini, J., Mansfield, A., **Call for U.S. ratification of the protocol on antarctic environment,** *Ecology law quarterly,* 1994, 21(1), p.163-241, 521 notes and refs.
DLC K5.C64

The Protocol on Environmental Protection to the Antarctic Treaty (Madrid Protocol) creates a comprehensive regime for assessing environmental impacts, biological conservation, waste disposal, and marine pollution prevention in Antarctica. Although the U.S. signed the protocol, it cannot be ratified until implementing legislation has been enacted. The enactment of strong implementing legislation is advocated, because the U.S. maintains the largest population of antarctic scientists and tourists. The protocol differs from previous agreements in four important areas: more stringent environmental protection, regulation of all activity in the Antarctic, an exclusive focus on environmental protection, and a comprehensive approach to environmental protection. The areas of conflict in the debate on implementing legislation have focused on which regulatory agency should bear primary authority; the relationship between the implementing legislation and existing legislation; and whether the U.S. should exceed certain norms of the protocol. Recommendations are proposed for overcoming these problems.

DLC JX4419.M265

This volume grew out of the international conference on the three areas of interest indicated in the book's title, addressing issues such as the development and components of the Antarctic Treaty regime, the legal and political features of the antarctic regime, environmental issues and the regime's future prospects.

M-53354
Kim, D.C., **Introduction: Global cooperation in the 1990s: Antarctica, law of the sea and marine environment,** Maritime issues in the 1990s: Antarctica, law of the sea and marine environment. Edited by D.C. Kim, C.H. Park, S.H. Lee, and J.H. Paik, Seoul, Yonsei Univeristy. Institute of East and West Studies, 1992, p.xiii-xix.
DLC JX4419.M265

In this introduction to the book "Maritime issues in the 1990s..." the author argues that it is time to have a fresh look at the global issues related to the oceans, particularly Antarctica, its influence over major global systems, its role as a recorder of global environmental changes, and the Antarctic Treaty regime. In this light, the global ocean regime is examined, with a review of various UN conferences on the law of the sea.

Lee, S.H., **Development and components of the Antarctic Treaty regime,** Maritime issues in the 1990s: Antarctica, law of the sea and marine environment. Edited by D.C. Kim, C.H. Park, S.H. Lee, and J.H. Paik, Seoul, Yonsei University. Institute of East and West Studies, 1992, p.3-16, 14 refs.
DLC JX4419.M265

The five principal components which comprise the Antarctic Treaty System (ATS)—the Antarctic Treaty, the Seals Convention, the CCAMLR, CRAMRA, and the Madrid Protocol—are described. The history of the development of the ATS is reviewed, and the challenge posed to it by many Third World nations, whose growing aspirations include regarding the Antarctic as part of the common heritage of mankind, is discussed. It is concluded that the regime seems to be able to overcome the challenge from the outside.

M-53356
Joyner, C.C., **Legal and political issues of the antarctic legal regime,** Maritime issues in the 1990s: Antarctica, law of the sea and marine environment. Edited by D.C. Kim, C.H. Park, S.H. Lee, and J.H. Paik, Seoul, Yonsei University. Institute of East and West Studies, 1992, p.17-42, 32 refs.
DLC JX4419.M265

In discussing the Antarctic Treaty System (ATS), which comprises the antarctic legal regime, three major issues holding political and legal significance are addressed: how necessary is an antarctic minerals regime, how comprehensive is antarctic environmental protection, and how best to manage antarctic marine living resources. A final discussion examines the negative and positive political and legal developments pertaining to Antarctica in the last three years, with the conclusion that only in a positive spirit of cooperation can the consultative parties ensure that the Antarctic Treaty will continue to benefit all mankind.

M-53357
Heap, J.A., **Environmental issues and future prospects of the antarctic regime,** Maritime issues in the 1990s: Antarctica, law of the sea and marine environment. Edited by D.C. Kim, C.H. Park, S.H. Lee, and J.H. Paik, Seoul, Yonsei University. Institute of East and West Studies, 1992, p.43-55, 3 refs.
DLC JX4419.M265

After review of some provisions of the Antarctic Treaty, the question of what has been achieved so far under the Antarctic Treaty Consultative Parties' custodianship of Antarctica is examined. The discussion is divided into five topics: conservation of wildlife, protected areas, protection of physical environment, exercise of forethought, and antarctic minerals. This is followed by a review and evaluation of the fundamental aspects of the Madrid Protocol and its Annexes. The conclusion is that the Protocol is both adequate for the job of protecting the environment and flexible enough to meet future requirements.

Perrin de Richambaut, M., **New era of the Antarctic Treaty** [La nouvelle ère du traité sur l'Antarctique], *Acta geographica,* Feb. 1995, No.102, p.36-43, In French.

In reviewing the merits of the Antarctic Treaty, it is pointed out that it functioned very well between 1959 and 1982, at which time the first difficulties begun to surface. The Wellington Convention of 1988, the controversy among the consultative parties at the time of the signing of the Madrid Protocol and during the 16th and 17th Antarctic Treaty Consultative meetings, and how these difficulties were surmounted, are given as proof of the adaptive capabilities of the Antarctic Treaty System. It is concluded that the Treaty is irreplaceable and should not be altered.

M-53524
London. Foreign and Commonwealth Office. South Atlantic and Antarctic Department. Polar Regions Section, **Guide to Environmental Impact Assessment of Activities in Antarctica,** London, 1995, 11p., 6 refs.

The Madrid Protocol requires that activities in Antarctica be controlled so as to avoid damaging the environment, and provides for Environmental Impact Assessment (EIA) procedures for proposed activities. The United Kingdom has ratified the Protocol. The necessary changes to United Kingdom law have been made by the Antarctic Act 1994 (the Act) and the Antarctic Regulations 1995 (the Regulations). The aim of this guide is to provide: a description of the principles of the Environmental Protocol; a brief description of the main provisions of the Antarctic Act; details of the EIA procedures required by the Antarctic Regulations; and advice on best practice in carrying out EIA.

International environmental law—the presumption against extraterritorial application of the National Environmental Policy Act: has the iron curtain been lifted?, *Land and water*

law review, 1994, 29(2), p.533-554, 178 refs.

DLC K12.A5

First, this casenote examines the issues concerning the extension of domestic law abroad. Second, it provides a general overview of NEPA (National Environmental Policy Act) and discusses the difficulty of interpreting NEPA's language. Third, the casenote considers the differing views regarding NEPA's extraterritorial application. Fourth, the casenote examines the federal judicial involvement with NEPA's extraterritorial application. Fifth, it explains the court of appeals' analysis in applying NEPA to federal agency action in Antarctica. The casenote further addresses the court's failure, in its narrow holding, to render a decision that clearly extends NEPA's application to all federal activities abroad. Finally, this casenote demonstrates that, despite the concerns raised by the Massey court's narrow holding, the combination of certain federal judicial decisions, legislative movement, and sociopolitical policy considerations favors the extraterritorial application of NEPA to all federal agency activities conducted overseas.

M-53558

Vidas, D., **Antarctic Treaty System and antarctic tourism: towards a legal regime?,** *International challenges,* 1994, 14(2), p.22-31, 1 ref.

The regulation of antarctic tourism has been in the focus of the Antarctic Treaty Consultative Parties (ATCPs) deliberations at several Consultative Meetings (ATCMs) over the past few years. It is the position recently taken by the ATCPs that the antarctic tourism regime already exists within the Antarctic Treaty System (ATS), and that it is merely a matter of its clear presentation to those addressed on how to implement such a regime. Another view is that a tourism regime is still a matter of an evolving process, which should ultimately result in a comprehensive regime suitable for regulating peculiarities of this specific human activity in the Antarctic.

M-53584

Andersen, R.M., **National Science Foundation strategy for compliance with environmental law in Antarctica,** Washington, D.C., U.S. National Science Foundation, 1989, 57p., 400 footnotes.

NSF and the Division of Polar Programs have implemented a number of programs in the last five years which have enhanced compliance with environmental laws governing antarctic operations. DPP also issued an Environmental Protection Agenda in Aug., 1988 that presented a plan to further remedy past mistakes and to prevent environmental harm from occurring in the future. This report recommends that additional actions be taken to bring NSF into full compliance with the law and to achieve sound environmental and conservation practices throughout Antarctica. It is suggested that NSF's Environmental Protection Agenda should now be revised to include the recommendations contained in this report.

M-53746

Wilder, M., **Settlement of disputes under the Protocol on Environmental Protection to the Antarctic Treaty,** *Polar record,* Oct. 1995, 31(179), p.399-408, Refs. p.407-408.

Since the Antarctic Treaty came into operation, antarctic affairs have been characterized by international cooperation. The major issues of potential conflict, namely sovereignty, military activity, and mining, have now been largely resolved. As a result, the remaining disagreements among parties have been resolved through consultation and negotiation. No dispute has ever found its way to judicial settlement, with most disagreements usually resolved at an early stage through ATCMs. While there is no reason to suspect that the use of consultation and negotiation will not continue, with the introduction of far more comprehensive measures for the protection of the antarctic environment, combined with the significant increase in activity in and around the continent, there is a greater likelihood of situations occurring that clearly breach these principles or give rise to a dispute. In addition, where extensive damage to the environment has already occurred, negotiation may be limited, so that other mechanisms for settling disputes must be instituted. The dispute procedures of the Protocol, taken almost entirely from CRAMRA, represent the most comprehensive system for the peaceful settlement of disputes arising in any antarctic instrument to date. (Auth. mod.)

M-53984

Joyner, C.C., **Fragile ecosystems: preclusive restoration in the Antarctic,** *Natural resources journal,* Fall 1994, 34(4), Special issue: The international law of ecological restoration, p.879-903, 91 refs.

DLC K14.A868

The Antarctic is a pristine frozen wasteland and a delicate ecosystem. To preserve and protect this region, certain states have committed themselves to a legal regime that performs "preclusive restoration." This regime pursues a purposeful strategy that aims at revitalization and restoration of the antarctic environment by implementing norms to prevent degradation and depletion of the antarctic ecosystem and its resources. A series of international agreements have been carefully crafted by these states to implement this strategy. Thus far, preclusive restoration has operated successfully. It is protecting and conserving antarctic flora and fauna, seals and other living marine resources in the circumpolar seas, and the antarctic environment in general. Most recently, preclusive restoration has been evidenced in the rejection of a negotiated antarctic minerals regime, a 50-year ban placed on the exploitation of mineral and hydrocarbon resources in the region, and the adoption of measures to control marine pollution, manage waste disposal, furnish environmental impact statements, and protect special areas. (Auth.)

M-53986

Joyner, C.C., Ewing, B.G., Jr., **Antarctica and the Latin American states: the interplay of law, geopolitics and environmental priorities,** *Georgetown international environmental law review,* 1991, 4(1), p.1-46, 230 refs.

DLC K7.E642

The principal aim of this article is to examine how Latin American national interests and geopolitical perspectives have contributed to the development of the present Antarctic Treaty regime, highlighting implications for the circumpolar environment. Accordingly, this article examines the evolution of key Latin American states' policies and their impacts on the present antarctic legal regime. The study also considers various political and legal effects of the treaty system on individual state behavior relating to contemporary environmental priorities in the Antarctic. The main thrust here is to assess how environmental considerations square with current Latin American geopolitical priorities. Finally, some conclusions on the future course of Latin American geopolitical concerns vis-à-vis the antarctic environment are suggested for critical reflection.

Mottesi, M.A., ***Foley* Doctrine revisited: application of the Resource Conservation and Recovery Act of 1976 in Antarctica,** *Georgetown international environmental law review,* 1991, 4(1), p.229-244, 87 refs.

DLC K7.E642

This article examines whether the National Science Foundation (NSF) is required to abide by the Resource Conservation and Recovery Act (RCRA) guidelines in its projects carried out in Antarctica. Since Antarctica is not part of the territorial United States, any suit brought against NSF for violating RCRA would require an examination of the extraterritorial reach of this statute. Part I of the article briefly explains the Antarctic Treaty regime and how it might affect this issue. Part II discusses the international law principles that allow the U.S. Congress to give statutes extraterritorial reach. Part III considers the *Foley* Doctrine, which stands for the principle that, unless otherwise indicated, statutes enacted by the U.S. Congress are presumed to apply only within the territorial United States. The author concludes that RCRA does not apply in Antarctica, because it lacks explicit extraterritorial language and therefore does not overcome the *Foley* presumption.

Recent elevation increase on Lambert Glacier [1994, eng] **F-52893**
Zweck, C.M.
Climate, the antarctic ice sheet and ground heat flux [1995, eng] **F-53491**

SUBJECT INDEX

Absorption

See under: Ionosphere. *See [also]:* Cosmic noise absorption; Polar cap absorption

Acclimatization

Acclimatization and fatty acid composition of the alga *Chlorella* [1995, eng] **B-53013**

Adaptation of the benthic microbial community in an inshore coastal sediment at Signy I. [1993, eng] **B-53273**

Adaptive mechanisms of the photosynthetic apparatus [1994, eng] **B-52563**

Antarctic Biology Meeting, 2nd, Padova, Feb. 26-28, 1992. Proceedings [1994, eng] **B-52539**

Antifreeze glycopeptide in the silverfish *Pleuragramma antarcticum* [1995, eng] **B-53327**

Bacteria in sea ice and underlying water of the eastern Weddell Sea in midwinter [1995, eng] **B-52453**

Biochemistry and freezing avoidance properties of the snailfish *Paraliparis devriesi* [1995, eng] **B-52237**

Biology, life cycle and ecophysiology of the antarctic mite *Alaskozetes antarcticus* [1995, eng] **B-53614**

Blood volume in the hemoglobinless antarctic teleost *Chionodraco hamatus* (Lönnberg) [1995, eng] **B-53621**

Cold adaptation of proteins [1994, eng] **B-52270**

Cold tolerance in Tardigrada from Dronning Maud Land, Antarctica [1995, eng] **B-52598**

Comparison of antioxidant defence and pro-oxidant processes in antarctic and Mediterranean scallops [1995, eng] **B-52990**

Comparison of lipid composition of intenstinal cell membranes between antarctic and temperate fish [1994, eng] **B-52556**

Cytogenetics and morphofunctional adaptations in Notothenioid fishes [1994, eng] **B-52549**

Differential scanning calorimetry in ecophysiological research [1994, eng] **B-53711**

Distribution and temperature tolerance of the mite *Antarcticola meyeri* [1995, eng] **B-52331**

Ecophysiology of polar algae [1995, eng] **B-52872**

Effects of heat shock and UV-B radiation on temperate and antarctic diatoms [1995, eng] **B-53082**

Electrophoretic determination of plasma proteins in *Notothenia neglecta* and *N. rossii* [1994, spa] **B-52012**

Endocrine basis of the reproductive pattern of the Gentoo penguin [1995, eng] **B-52881**

Energy contents and organic constituents in brown algae [1995, eng] **B-53934**

Evolution of the antarctic marine benthic algal flora [1994, eng] **B-52378**

Genomic basis for antifreeze peptide heterogeneity and abundance in eel pout [1995, eng] **B-53326**

Growth and metabolism in antarctic fish [1993, eng] **B-53275**

Growth and survival strategy of the antarctic mite *Alaskozetes antarcticus* [1994, eng] **B-53710**

Gut regulatory peptides in some antarctic notothenioids [1995, eng] **B-53415**

Habitat temperature and locomotor activity of the mite *Maudheimia petronia* Wallwork [1995, eng] **B-52335**

Heat shock response of an antarctic alga is evident at 5°C [1994, eng] **B-51975**

Heavy metal cation homeostasis in the scallop *Adamussium colbecki* (Smith 1902) [1994, eng] **B-52561**

Heavy metals and antioxidant enzymes in antarctic Protozoa and fish [1994, eng] **B-52562**

Influence of acclimatization and substratum on the metabolism of two amphipods [1995, eng] **B-52599**

Microalgal light-harvesting in McMurdo Sound [1995, eng] **B-53547**

Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] **B-52555**

Molecular evolution at subzero temperatures: fish mitochondrial and nuclear phylogenies [1994, eng] **B-52475**

Morphofunctional design of the heart of the icefish *Chionodraco hamatus* (Lonnberg) [1994, eng] **B-52557**

Mycological researches in Victoria Land: terrestrial ecosystems [1994, eng] **B-52541**

New type of bryozoan from Antarctica [1995, eng] **B-54016**

Novel neural beta tubulin from the antarctic fish *Notothenia coriiceps neglecta* [1993, eng] **B-52261**

Phosphorylation of lipopolysaccharides in *Pseudomonas syringae* [1994, eng] **B-52269**

Photoautotrophic picoplankton of Terra Nova Bay and some northern Victoria Land lakes [1994, eng] **B-52545**

Photoinhibition as a regulative mechanism of photosynthesis in marine algae of Antarctica [1994, eng] **B-52156**

Soluble carbohydrates and polyols as plant cryoprotectants [1993, eng] **B-53272**

Stem and leaf study of *Colobanthus quitensis* (Kunth) Bartl. from King George I. [1994, spa] **B-52154**

Structual diversity in the lateral line system of antarctic fish: adaptive or non-adaptive? [1995, eng] **B-53451**

Structure and function of hemoglobins, enzymes and other proteins [1994, eng] **B-52554**

Supercooling points and water content in Acari [1994, eng] **B-53712**

Survival of intracellular freezing by the antarctic nematode *Panagrolaimus davidi* [1995, eng] **B-53532**

Temperature and growth rate of the mite *Alaskozetes antarcticus* [1994, eng] **B-51982**

Temperature and lipid pattern, and fatty acid composition, in thermophilic isolates [1995, eng] **B-53525**

Temperature relations of soil protists as an indicator of climatic change [1995, eng] **B-53325**

Thermolabile alkaline phosphatase from *Sphingobacterium antarcticus* [1995, eng] **B-52597**

Thermolabile ribonucleases from antarctic psychrotrophic bacteria [1994, eng] **B-52590**

Thermophilic fungi and actinomycetes from Mt. Erebus [1983, eng] **B-53233**

Thermophilic isolates from Antarctica [1994, eng] **B-52553**

Tyrosine phosphorylation of a cytoplasmic protein from the antarctic psychrotrophic bacterium *Pseudomonas syringae* [1994, eng] **B-52589**

See [also]: Ecology; Isolation effects; Low temperature effects

Acoustical properties

See: Sea water/Acoustics. *Also used as subordinate term under various types of ice (snow)*

Administration

Annual report, 1993/94 [1994, eng] **A-52711**

End of season report: Operation Deep Freeze 94/95 [1995, eng] **G-52611**

Information management [1994, eng] **A-52069**

Management and assessment options for the crab fishery around South Georgia [1994, eng] **A-52004**

NSF's South Pole Station plan clears technical hurdles [1994, eng] **A-52395**

Operation Order 201. "Operation Deep Freeze" 94/95 [1994, eng] **G-52370**

Plan for antarctic scientific research, 1995-2000 [1995, spa] **A-53190**

Report of the CCAMLR 13th meeting, 1994 [1994, eng] **B-53100**

SCAR bulletin No.114, July 1994 [1994, eng] **A-52429**

Science in support of southern ocean fisheries management [1995, eng] **A-52660**

Aerial navigation

See: Navigation/Air

Aerial photography

Classification of MOS-1 VTIR images in the Antarctic, a case study [1994, eng] **I-51883**

Coastal-change and glaciological maps of Antarctica [1995, eng] **F-53498**

Detailed elevation map of Ice Stream C [1994, eng] **F-52939**

Detection of clouds over polar oceans from AVHRR daylight images [1994, eng] **I-52494**

Development of enhanced ice flow at the southern margin of Ice Stream D, Antarctica [1994, eng] **F-52937**

Dynamics of Cook Glacier, Ile de Kerguelen [1994, fre] **F-52531**

Elevation data of a satellite-image map of Filchner-Ronne Ice Shelf [1994, eng] **F-52942**

Enhanced resolution ERS-1 scatterometer imaging of southern hemisphere polar ice [1994, eng] **F-51844**

Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] **F-52951**

Ice motion analysis on different spatial scales in the Weddell Sea [1995, eng] **F-53482**

Intercomparisons of sea ice concentration from SSM/I and AVHRR data of the Ross Sea [1995, eng] **F-53810**

Landsat TM image maps of the Shirase and Siple Coast ice streams, West Antarctica [1994, eng] **F-52952**
Mapping ice front changes of Müller Ice Shelf, Antarctic Peninsula [1995, eng] **F-52842**
Method to estimate subpixel-scale coastal polynyas with satellite passive microwave data [1995, eng] **F-52464**
Monitoring Mount Erebus by satellite remote sensing [1994, eng] **E-52434**
Progress in polar oceans research using ERS-1 data [1994, eng] **C-51850**
RADARSAT and operational ice information [1994, eng] **C-52425**
Recent sea-ice advances in Baffin Bay/Davis Strait and retreats in the Bellingshausen Sea [1995, eng] **F-53500**
Remote sensing of southern ocean sea ice geophysics [1994, eng] **F-51845**
Satellite imagery of glacier variation on James Ross I. [1995, eng] **F-53499**
Satellite monitoring of king penguin population increase on Crozet Is. [1995, eng] **B-53687**
Satellite retrieval of temperature profiles over sea ice [1995, eng] **I-53483**
Sea-ice velocity fields estimation on Ross Sea AVHRR images [1994, eng] **F-51847**
Sea-ice velocity fields estimation on Ross Sea with NOAA-AVHRR [1995, eng] **F-53833**
Simple shape-from-shading algorithm applied to images of ice-covered terrain [1994, eng] **F-52321**
Some active and passive microwave signatures of antarctic sea ice from mid-winter to spring 1991 [1995, eng] **F-53596**
Spatial resolution improvement of SSM/I data with image restoration techniques [1994, eng] **F-51819**
Study on glacier movement using satellite SAR and visible/near-IR imagery [1994, eng] **F-51851**
Surface-velocity field of the northern Larsen Ice Shelf, Antarctica [1994, eng] **F-52938**
Tracking of antarctic tabular icebergs using passive microwave radiometry [1995, eng] **F-52426**
Velocities of Pine Island Glacier, West Antarctica, from ERS-1 SAR images [1995, eng] **F-53497**

Stone crabs close to the antarctic continent: *Lithodes murrayi* Henderson, 1888 [1995, eng] **B-52341**

Studies on antarctic euphausiids [1993, eng] B-52997
EMBRYOLOGY
Behavior and ecology of the beach-hopper *Orchestia scutigerula* Dana from South Georgia [1995, eng] B-53184
Energetic cost of egg production in krill [1995, eng] B-52310
Krill reproduction in Prydz Bay [1995, eng] B-53993
Laboratory reproduction of the copepod *Calanus propinquus* in the Weddell Sea [1994, eng] B-52629
RACER: *Euphausia superba* in Gerlache Strait, Antarctica, springs of 1989 and 1991 [1993, eng] B-52721
Spatial and temporal variability in reproductive timing of krill [1995, eng] B-52593
EVOLUTION
Genetic differentiation in antarctic and subantarctic marine invertebrates. [1994, eng] B-52551
New genus and species of the family Laophontidae from the Weddell Sea [1995, eng] B-53254
EXPLOITATION
Antarctic juvenile fish taken in krill fisheries around South Georgia in 1992 [1994, eng] A-51999
Antarctic resources: a dichotomy of interest [1991, eng] A-52874
Assessment of the impact of the krill fishery on penguins in the South Shetlands [1994, eng] B-51998
Effects of parasitism on the management of the crab fishery around South Georgia [1994, eng] B-52003
Inevitable consequences of large-scale krill fishing in the Antarctic [1993, rus] A-53790
Krill distribution and fisheries in the South Orkney Islands region [1993, rus] A-53788
Krill harvesting and man's role in the trophic chain [1993, rus] A-53789
Management and assessment options for the crab fishery around South Georgia [1994, eng] A-52004
Preliminary model of krill fishery behaviour in Subarea 48.1 [1994, eng] A-51996
Presence of two crab species in catches in the Scotia Sea [1994, eng] B-52002
Report of the SC-CAMLR 13th meeting, 1994 [1994, eng] B-53099
Setting the annual krill catch limit to a fixed fraction of the krill biomass estimate [1994, eng] A-51997
Simulation model of the antarctic krill population [1993, rus] A-53791
Survival of krill escaping from the trawl [1993, rus] A-53794
Training research trawl of the Samyshev-Evdokimov design [1993, rus] A-53792
Trawl mesh form influence on its selective properties as exemplified by antarctic krill [1993, rus] A-53793
GEOGRAPHIC DISTRIBUTION
Acoustic estimates of krill biomass in the Elephant Island area: 1981-1993 [1994, eng] A-51991
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] B-52731
Antarctic krill and the structure of plankton community in its areal [1991, rus] B-53418
Biological acoustic survey in the marginal ice-edge zone of the Bellingshausen Sea [1995, eng] B-53853
Biological features of copepod species in the Weddell Sea [1994, eng] B-52164
Biomass estimates of *Euphausia superba* [1995, eng] B-53306
Cladistic placement of the subantarctic genus *Haversiella* (Coleoptera: Curculionidae) [1994, eng] B-53580
Copepoda (Cyclopoida) from the Croker Passage (Antarctica, June-August, 1989) [1993, eng] B-53087
Copepods collected by the Italian expedition of 1987-1988 [1990, eng] B-53902
Distribution and abundance of seasonal variations of *Oithona* and *Oncaea* in the Weddell Sea [1995, eng] B-52594
Estimating krill recruitment and its variability [1994, eng] B-51995
Feeding and distribution of *Metridia gerlachei* in coastal waters of the Antarctic Peninsula [1995, eng] B-52333
First record of a terrestrial landhopper from Macquarie I. [1995, eng] B-53413
Functional structure of the distribution of *Euphausia superba* Dana [1993, rus] B-53786
Krill abundance and distribution around Elephant I. in summer of 1993 [1993, eng] B-52725
Krill biomass in the Atlantic [1995, eng] A-51963
Krill distribution and fisheries in the South Orkney Islands region [1993, rus] A-53788
Krill life cycle and distribution [1993, rus] B-53785
Krill role in the antarctic ecosystem [1994, eng] B-51694
Krill winter home in Gerlache Strait [1994, eng] B-52643
Macroplankton of the Lazarev Sea [1994, eng] B-52522
Mysidacea (Crustacea) from Kerguelen, Crozet and Bouvet islands collected between 1972 and 1982 [1995, fre] B-52994
New antarctic stenothoids [1992, ger] B-52078
Planktic Ostracoda from the Antarctic and the Subantarctic, 1989-1990 [1994, eng] B-52827
Post-hatching diet of Adélie penguins in Hope Bay, 1987-1988 [1995, eng] B-53412
Preliminary model of krill fishery behaviour in Subarea 48.1 [1994, eng] A-51996
Presence of two crab species in catches in the Scotia Sea [1994, eng] B-52002
Record of ostracoda from the Great Wall Bay of King George Island, Antarctica [1994, chi] B-53169
Report on planktic Ostracoda from the Ross Sea, Antarctica [1990, eng] B-53905
Role of water dynamics in antarctic krill swarm formation and movement [1993, rus] J-53769
Salp and krill distribution near the South Shetlands during summer 1990-1991 [1995, eng] B-52334
Simulation model of the antarctic krill population [1993, rus] A-53791
Spawning and larval krill swarm formation in More Somova [1993, rus] B-53770
Status of the FIBEX acoustic data from the West Atlantic [1994, eng] B-51993
Status of the krill stock around Elephant Island in 1991/92 and 1992/93 [1994, eng] B-51992
Stone crabs close to the antarctic continent: *Lithodes murrayi* Henderson, 1888 [1995, eng] B-52341
Studies on antarctic euphausiids [1993, eng] B-52997
Study of copepods from Terra Nova Bay [1990, eng] B-53903
Trace element concentrations in antarctic krill, *Euphausia superba* [1995, eng] B-52785
Under-ice zooplankton of the western Weddell Sea [1995, eng] B-53008
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] B-52853
Zooplankton composition and variation in waters near Great Wall Station [1994, eng] B-52274
Zooplankton vertical distribution in the Commonwealth Sea [1993, rus] B-53784
MIGRATION
Biological features of copepod species in the Weddell Sea [1994, eng] B-52164
Kerguelen Miocene marine fauna [1994, fre] E-53081
Response of the copepod community to a spring bloom in the Bellingshausen Sea [1995, eng] B-53859
Seasonal and diel changes in the abundance and vertical distribution of 5 copepod species from Croker Passage [1993, eng] B-52854
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] B-52853
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] B-53891
MORPHOLOGY
Compound eye as an indicator of age and shrinkage in antarctic krill [1995, eng] B-53955
Copepods collected by the Italian expedition of 1987-1988 [1990, eng] B-53902
First record of a terrestrial landhopper from Macquarie I. [1995, eng] B-53413
Fossil mole crabs from Late Cretaceous rocks on James Ross Island, Antarctic Peninsula [1993, eng] E-51681
Intracerebral ocelli in the giant antarctic slater [1995, eng] B-52796
Morphology and anatomy of *Avdeevia antarctica,* n.gen. n.sp., a cephalopod parasite [1994, eng] B-52099
New genus and species of the family Laophontidae from the Weddell Sea [1995, eng] B-53254
Planktic Ostracoda from the Antarctic and the Subantarctic, 1989-1990 [1994, eng] B-52827
Report on planktic Ostracoda from the Ross Sea, Antarctica [1990, eng] B-53905
Seasonal abundance and size variation in micro-crustaceans [1995, eng] B-53956
Stone crabs close to the antarctic continent: *Lithodes murrayi* Henderson, 1888 [1995, eng] B-52341
Structure and filtration process of feeding mechanisms in euphausiids [1993, rus] B-53787
NUTRITION
Ammonium cycling by antarctic zooplankton in winter [1995, eng] B-52129
Assimilation and egestion of algal lipid by antarctic krill [1995, eng] B-52749
Behavior and ecology of the beach-hopper *Orchestia scutigerula* Dana from South Georgia [1995, eng] B-53184

Biogenic production of dimethyl sulfide: krill grazing [1993, eng] **B-52260**
Diets and feeding selectivity among the epipelagic copepod community near South Georgia in summer [1994, eng] **B-51769**
Feeding and distribution of *Metridia gerlachei* in coastal waters of the Antarctic Peninsula [1995, eng] **B-52333**
Feeding of dominant species of antarctic zooplankton in summer [1993, rus] **B-53805**
Food and feeding in *Euphausia superba:* individual variation [1994, eng] **B-52220**
Gut contents and feeding pattern in copepods from the Weddell Sea [1995, eng] **B-53932**
Krill grazing on *Nitschia* sp. and *Phaeocystis* sp. monocultures [1993, eng] **B-52738**
Lipid composition of antarctic microplankton in relation to the nutrition of krill [1993, eng] **B-53274**
Lipid metabolism of antarctic copepods [1995, ger] **B-52301**
Nutrition effects on the metabolic rate of the amphipod *Waldeckia obesa* [1994, eng] **B-51981**
Overwintering strategies of antarctic crustacea [1994, eng] **B-51660**
Physiology of the copepod *Calanoides acutis* during late summer in the Weddell Sea [1994, eng] **B-52628**
Response of the copepod community to a spring bloom in the Bellingshausen Sea [1995, eng] **B-53859**
Structure and filtration process of feeding mechanisms in euphausiids [1993, rus] **B-53787**
Study of the diel rhythm of feeding in the antarctic copepod, *Calanus propinquus* [1991, eng] **B-53728**
Winter population structure and feeding of chaetognaths and copepods in Gerlache Strait [1995, eng] **B-52583**

PATHOLOGY

Antibacterial activity in crustacean hemocytes [1995, eng] **B-52775**
Effects of parasitism on the management of the crab fishery around South Georgia [1994, eng] **B-52003**
PCB ocean pollution at Saint Paul and Amsterdam Is. [1995, eng] **J-53517**
Polar news/Notizie polari, Vol.9, No.12 [1994, ita] **A-52305**
Survival of krill escaping from the trawl [1993, rus] **A-53794**

PHYSIOLOGY

Aging the antarctic krill [1995, chi] **B-53950**
Antarctic crustacean metabolism as a depth/seasonal function [1994, eng] **B-51659**
Antarctic krill and the structure of plankton community in its areal [1991, rus] **B-53418**
Assimilation and egestion of algal lipid by antarctic krill [1995, eng] **B-52749**
Behavior and ecology of the beach-hopper *Orchestia scutigerula* Dana from South Georgia [1995, eng] **B-53184**
Biochemical composition changes in antarctic copepods during summer-to-winter transitions [1993, rus] **B-53800**
Biological features of copepod species in the Weddell Sea [1994, eng] **B-52164**
Changes in phosphorus composition in antarctic copepods [1993, rus] **B-53801**
Coastal marine ecosystem research at Showa Station [1994, eng] **B-52569**
Compound eye as an indicator of age and shrinkage in antarctic krill [1995, eng] **B-53955**
Demographic studies of krill in the Indian Ocean [1995, eng] **B-52582**
Diets and feeding selectivity among the epipelagic copepod community near South Georgia in summer [1994, eng] **B-51769**
Energetic cost of egg production in krill [1995, eng] **B-52310**
Functional structure of the distribution of *Euphausia superba* Dana [1993, rus] **B-53786**
Genetic differentiation in antarctic and subantarctic marine invertebrates. [1994, eng] **B-52551**
Influence of acclimatization and substratum on the metabolism of two amphipods [1995, eng] **B-52599**
Intracerebral ocelli in the giant antarctic slater [1995, eng] **B-52796**
Krill grazing on *Nitschia* sp. and *Phaeocystis* sp. monocultures [1993, eng] **B-52738**
Krill life cycle and distribution [1993, rus] **B-53785**
Krill natural age-dependent mortality rates in the Indian Ocean [1995, eng] **B-52340**
Krill reproduction in Prydz Bay [1995, eng] **B-53993**
Laboratory reproduction of the copepod *Calanus propinquus* in the Weddell Sea [1994, eng] **B-52629**
Larval crustacean decapods in Terra Nova Bay [1990, eng] **B-53904**
Lipid metabolism of antarctic copepods [1995, ger] **B-52301**
Modelling krill recruitment [1994, eng] **B-51994**
Mono- and polyunsaturated sedimentary hydrocarbons in the lipids of marine organisms [1995, eng] **B-52782**
Nutrition effects on the metabolic rate of the amphipod *Waldeckia obesa* [1994, eng] **B-51981**
Overwintering strategies of antarctic crustacea [1994, eng] **B-51660**
Physiology of the copepod *Calanoides acutis* during late summer in the Weddell Sea [1994, eng] **B-52628**
Propulsion jet of krill as a potential communication signal [1995, eng] **B-52995**
Seasonal abundance and size variation in micro-crustaceans [1995, eng] **B-53956**
Spatial and temporal variability in reproductive timing of krill [1995, eng] **B-52593**
Status of the krill stock around Elephant Island in 1991/92 and 1992/93 [1994, eng] **B-51992**
Structure and filtration process of feeding mechanisms in euphausiids [1993, rus] **B-53787**
Studies on antarctic euphausiids [1993, eng] **B-52997**
Thermal tolerance of two antarctic copepods [1995, eng] **B-52679**
Trace element concentrations in antarctic krill, *Euphausia superba* [1995, eng] **B-52785**
Variation in the lipid content and composition of krill at South Georgia [1995, eng] **B-52452**
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] **B-52853**

POPULATION

Acoustic estimates of krill biomass in the Elephant Island area: 1981-1993 [1994, eng] **A-51991**
Acoustic, trawl and trapping surveys of the epipelagic communities in the Weddell Sea [1993, eng] **B-52259**
Aging the antarctic krill [1995, chi] **B-53950**
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] **B-52731**
AMLR program: Krill and macrozooplankton in the Elephant Island area, January to March 1993 [1993, eng] **B-52726**
Antarctic krill and the structure of plankton community in its areal [1991, rus] **B-53418**
Assessment of the impact of the krill fishery on penguins in the South Shetlands [1994, eng] **B-51998**
Biological acoustic survey in the marginal ice-edge zone of the Bellingshausen Sea [1995, eng] **B-53853**
Biological features of copepod species in the Weddell Sea [1994, eng] **B-52164**
Biomass estimates of *Euphausia superba* [1995, eng] **B-53306**
Copepoda (Cyclopoida) from the Croker Passage (Antarctica, June-August, 1989) [1993, eng] **B-53087**
Copepods collected by the Italian expedition of 1987-1988 [1990, eng] **B-53902**
Demographic studies of krill in the Indian Ocean [1995, eng] **B-52582**
Diet of the mackerel icefish at South Georgia [1994, eng] **B-52880**
Distribution and abundance of seasonal variations of *Oithona* and *Oncaea* in the Weddell Sea [1995, eng] **B-52594**
Estimating krill recruitment and its variability [1994, eng] **B-51995**
Feeding and distribution of *Metridia gerlachei* in coastal waters of the Antarctic Peninsula [1995, eng] **B-52333**
First record of a terrestrial landhopper from Macquarie I. [1995, eng] **B-53413**
Krill abundance and distribution around Elephant I. in summer of 1993 [1993, eng] **B-52725**
Krill acoustic studies and results from the Antarctic Peninsula grid [1993, eng] **B-52736**
Krill and sea ice cover [1994, eng] **B-53743**
Krill biomass in the Atlantic [1995, eng] **A-51963**
Krill distribution and fisheries in the South Orkney Islands region [1993, rus] **A-53788**
Krill harvesting and man's role in the trophic chain [1993, rus] **A-53789**
Krill life cycle and distribution [1993, rus] **B-53785**
Krill role in the antarctic ecosystem [1994, eng] **B-51694**
Krill winter home in Gerlache Strait [1994, eng] **B-52643**
Larval crustacean decapods in Terra Nova Bay [1990, eng] **B-53904**
Macroplankton of the Lazarev Sea [1994, eng] **B-52522**
Modelling krill recruitment [1994, eng] **B-51994**
Mysidacea (Crustacea) from Kerguelen, Crozet and Bouvet islands collected between 1972 and 1982 [1995, fre] **B-52994**
Palmer LTER: Krill distribution and biomass within coastal waters near Palmer Station [1993, eng] **B-52737**
Quantitative and functional studies of the Terra Nova Bay benthos [1991, eng] **B-53880**
RACER: *Euphausia superba* in Gerlache Strait, Antarctica, springs of 1989 and 1991 [1993, eng] **B-52721**
Recruitment and variability in antarctic krill [1995, eng] **B-53599**
Report on planktic Ostracoda from the Ross Sea, Antarctica [1990, eng] **B-53905**

Response of the copepod community to a spring bloom in the Bellingshausen Sea [1995, eng] **B-53859**
Role of water dynamics in antarctic krill swarm formation and movement [1993, rus] **J-53769**
Salp and krill distribution near the South Shetlands during summer 1990-1991 [1995, eng] **B-52334**
Seasonal abundance and size variation in micro-crustaceans [1995, eng] **B-53956**
Seasonal and diel changes in the abundance and vertical distribution of 5 copepod species from Croker Passage [1993, eng] **B-52854**
Seasonal reconstruction of the antarctic plankton community [1993, rus] **B-53798**
Setting the annual krill catch limit to a fixed fraction of the krill biomass estimate [1994, eng] **A-51997**
Simulation model of the antarctic krill population [1993, rus] **A-53791**
Spawning and larval krill swarm formation in More Somova [1993, rus] **B-53770**
Status of the FIBEX acoustic data from the West Atlantic [1994, eng] **B-51993**
Status of the krill stock around Elephant Island in 1991/92 and 1992/93 [1994, eng] **B-51992**
Study of copepods from Terra Nova Bay [1990, eng] **B-53903**
Summer distribution of nano- and microalgae in Prydz Bay and the Indian Ocean [1994, eng] **B-52277**
Trace element concentrations in antarctic krill, *Euphausia superba* [1995, eng] **B-52785**
Under-ice zooplankton of the western Weddell Sea [1995, eng] **B-53008**
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] **B-52853**
Weddell Sea: a high polar ecosystem [1992, eng] **B-53967**
Zooplankton composition and variation in waters near Great Wall Station [1994, eng] **B-52274**
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] **B-53891**
Zooplankton vertical distribution in the Commonwealth Sea [1993, rus] **B-53784**

TAXONOMY
Copepoda (Cyclopoida) from the Croker Passage (Antarctica, June-August, 1989) [1993, eng] **B-53087**
Fossil mole crabs from Late Cretaceous rocks on James Ross Island, Antarctic Peninsula [1993, eng] **E-51681**
Larval crustacean decapods in Terra Nova Bay [1990, eng] **B-53904**
Morphology and anatomy of *Avdeevia antarctica,* n.gen. n.sp., a cephalopod parasite [1994, eng] **B-52099**
New antarctic stenothoids [1992, ger] **B-52078**
New Eocene crab (Crustacea, Decapoda) from Seymour Island, Antarctica [1995, eng] **E-53466**
New genus and species of the family Laophontidae from the Weddell Sea [1995, eng] **B-53254**
Planktic Ostracoda from the Antarctic and the Subantarctic, 1989-1990 [1994, eng] **B-52827**
Record of ostracoda from the Great Wall Bay of King George Island, Antarctica [1994, chi] **B-53169**
Report on planktic Ostracoda from the Ross Sea, Antarctica [1990, eng] **B-53905**

Arthropoda—Insecta
Simulation of polar microarthropod response to global warming [1994, eng] **B-51830**

BREEDING CYCLES AND REPRODUCTION
Biology of *Eudonia mawsoni* from Macquarie I. [1995, eng] **B-52786**
Effects of a carnivorous carabid beetle from South Georgia on the endemic herbivorous beetles [1995, eng] **B-53252**
Tardigrades from Mawson Coast [1995, eng] **B-53329**
Use of field enclosures to measure growth and mortality rates in an antarctic collembolan [1994, eng] **B-52855**

ECOLOGY
Biology of *Eudonia mawsoni* from Macquarie I. [1995, eng] **B-52786**
Marine littoral and coastal Collembola on the subantarctic Macquarie Island [1994, eng] **B-52856**
Nematodes, rotifers and tardigrades from nunataks in Queen Maud Land [1995, eng] **B-52337**
Recently established Diptera and Lepidoptera on Marion I. [1994, eng] **B-52272**
Survey of stream invertebrate communities on Macquarie Island [1994, eng] **B-52457**
Tardigrades from Mawson Coast [1995, eng] **B-53329**
Use of field enclosures to measure growth and mortality rates in an antarctic collembolan [1994, eng] **B-52855**

GEOGRAPHIC DISTRIBUTION
Arthropoda from Sør Rondane Mountains, with biogeographical notes [1995, eng] **B-53110**
Marine littoral and coastal Collembola on the subantarctic Macquarie Island [1994, eng] **B-52856**
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] **B-52548**
Recently established Diptera and Lepidoptera on Marion I. [1994, eng] **B-52272**
Tardigrades from Mawson Coast [1995, eng] **B-53329**

MORPHOLOGY
Cladistic placement of the subantarctic genus *Haversiella* (Coleoptera: Curculionidae) [1994, eng] **B-53580**
Effects of a carnivorous carabid beetle from South Georgia on the endemic herbivorous beetles [1995, eng] **B-53252**
Eye morphology in an antarctic midge [1994, eng] **B-52627**
New *Bothrometopus* species from Possession I. [1994, eng] **B-52271**
Tardigrades from Mawson Coast [1995, eng] **B-53329**

NUTRITION
Effects of a carnivorous carabid beetle from South Georgia on the endemic herbivorous beetles [1995, eng] **B-53252**

PHYSIOLOGY
Cold tolerance in Tardigrada from Dronning Maud Land, Antarctica [1995, eng] **B-52598**
Differential scanning calorimetry in ecophysiological research [1994, eng] **B-53711**
Effects of a carnivorous carabid beetle from South Georgia on the endemic herbivorous beetles [1995, eng] **B-53252**
Genetic population structure of beetles from South Georgia and the Falkland Is. [1995, eng] **B-53688**
New *Bothrometopus* species from Possession I. [1994, eng] **B-52271**
Use of field enclosures to measure growth and mortality rates in an antarctic collembolan [1994, eng] **B-52855**

POPULATION
Biology of *Eudonia mawsoni* from Macquarie I. [1995, eng] **B-52786**
Effects of a carnivorous carabid beetle from South Georgia on the endemic herbivorous beetles [1995, eng] **B-53252**
Genetic population structure of beetles from South Georgia and the Falkland Is. [1995, eng] **B-53688**
Marine littoral and coastal Collembola on the subantarctic Macquarie Island [1994, eng] **B-52856**
Nematodes, rotifers and tardigrades from nunataks in Queen Maud Land [1995, eng] **B-52337**
Survey of stream invertebrate communities on Macquarie Island [1994, eng] **B-52457**

TAXONOMY
Cladistic placement of the subantarctic genus *Haversiella* (Coleoptera: Curculionidae) [1994, eng] **B-53580**
Genetic population structure of beetles from South Georgia and the Falkland Is. [1995, eng] **B-53688**
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] **B-52548**
New *Bothrometopus* species from Possession I. [1994, eng] **B-52271**
Survey of stream invertebrate communities on Macquarie Island [1994, eng] **B-52457**

Astronomy
Cosmic microwave background anisotropy [1995, eng] **K-52792**
Direct imaging of planetary systems with a ground-based radiotelescope array [1994, eng] **K-51859**
Helioseismology from the South Pole: closer connections with geoseismology [1993, eng] **K-53673**
Newsletter, No.36, Mar. 1994 [1994, eng] **A-53552**
Optical all-sky viewing double dome for South Pole Station [1993, eng] **K-53671**
SCAR meeting, 22nd, Bariloche, Argentina, June 1992 [1992, eng] **K-53226**
SCAR meeting, June 1992, Bariloche, Argentina [1992, eng] **K-53227**
Stargazing at the South Pole [1991, eng] **K-53578**
Study of calcium-K network evolution from Antarctica [1994, eng] **K-52350**
Upper atmosphere semidiurnal tides at Christchurch (44S) and Scott Base (78S) [1995, eng] **K-52849**

Atmosphere
Conference proceedings of the Italian Research on Antarctic Atmosphere, Vol.45 [1994, eng] **I-52482**
Fluctuations in earth's rotation [1987, eng] **I-53390**
Future ocean-atmosphere research in the antarctic region [1994, eng] **A-51700**

BrO + ClO reaction and the polar stratospheric ozone [1990, eng] **I-53147**
CAO data on the dependence of ozone density and relative mixture on angle of maximum solar elevation [1992, rus] **I-53555**
Carbon dioxide in the southern ocean between 88°W and 80°E in summer [1995, eng] **J-53848**
Carbon monoxide in the antarctic atmosphere: observations of decreasing concentrations [1993, eng] **I-53063**
Changes in polar ozone [1992, eng] **I-51825**
Chemical composition of ancient atmospheres: a model study constrained by ice core data [1995, eng] **I-53430**
Chemical composition of particulate organic matter from Terra Nova Bay [1994, eng] **I-52490**
Chemistry and climatic role of biogenic sulfur: group discussion [1995, eng] **I-53507**
Chlorine monoxide variations in the spring antarctic vortex [1995, eng] **I-53429**
Chlorine monoxide variations over Thule, Greenland, 1993 [1994, eng] **I-51872**
Closing off the southern ocean surface [1995, eng] **I-52517**
CO_2 air-sea fluxes in the Antarctic Ocean [1995, eng] **J-52649**
CO_2 evolution during the last millennium as recorded by antarctic and Greenland ice [1995, eng] **I-52651**
CO_2 pressure between Iceland and the Antarctic Peninsula [1995, eng] **J-52650**
Complex refractive indices in the infrared of nitric acid trihydrate aerosols [1995, eng] **I-53914**
Composition and freezing of aqueous H_2SO_4/HNO_3 solutions under polar stratospheric conditions [1994, eng] **I-53285**
Compositions and mass fluxes of the Mount Erebus volcanic plume [1994, eng] **E-52437**
Continued decline of total ozone over Halley, Antarctica, since 1985 [1995, eng] **I-53215**
Continuous trans-Atlantic and Pacific meteorological and climatic measurements in both hemispheres [1994, eng] **I-52493**
Counting condensation nuclei in the antarctic ozone mission [1994, eng] **I-52958**
Decline in polar stratospheric ozone as observed by NOAA infrared sounders [1993, eng] **I-52804**
Deep ice drilling on Law Dome: initial environmental evaluation [1989, eng] **A-52389**
Descent of long-lived trace gases in the winter polar vortex [1995, eng] **I-53368**
Determination of lead isotopes in arctic and antarctic snow and ice [1994, eng] **F-51972**
Dimethyl sulfide flux in antarctic and subantarctic oceans, 1988-89 [1995, eng] **J-53198**
Dispersal of volcano-derived particles from Mount Erebus in the antarctic atmosphere [1994, eng] **E-52438**
Efficiency of formation of CH_3O in the reaction of CH_3O_2 with ClO [1995, eng] **I-53048**
Elemental tracers of volcanic emissions from Mount Erebus in antarctic snow samples [1994, eng] **E-52439**
Elements of stratospheric and tropospheric chemistry [1994, eng] **I-52322**
Environmental study carried out during the 8th, 9th and 10th Indian antarctic expeditions [1994, eng] **I-53444**
Evidence for midwinter chemical ozone destruction over Antarctica [1995, eng] **I-53721**
Evolution of microwave limb sounder ozone and the polar vortex during winter [1995, eng] **I-52512**
Evolution of Pinatubo and Cerro Hudson aerosol over the Antarctic during the 1991 austral spring [1993, eng] **I-52632**
Evolution of the dehydration in the antarctic stratospheric vortex [1995, eng] **I-53425**
Experimental results of the Polar Patrol Balloon project [1995, eng] **K-53133**
Freezing behavior of stratospheric sulfate aerosols inferred from trajectory studies [1995, eng] **I-53193**
FTIR studies of low temperature sulfuric acid aerosols [1995, eng] **I-52848**
Further evidence of marine organic matter transport in antarctic snow via air-sea exchange [1994, eng] **I-52492**
FY 1994 ambient air monitoring report for McMurdo Station, Antarctica [1994, eng] **I-53145**
GCM simulations of atmospheric tracers in Antarctica and Greenland [1995, eng] **I-52133**
General circulation model study of ozone depletion, 1980-1990 [1994, eng] **I-53406**
Glaciochemical studies of aerosol fallout from Mount Erebus [1994, eng] **F-52440**
Global increase of SF_6 observed in the atmosphere [1994, eng] **I-52987**
Global ozone destruction rates from satellite data, 1979-1991 [1994, eng] **I-53398**
Growth of nitric acid hydrates on thin sulfuric acid films [1994, eng] **I-53284**
H_2O_2 and HCHO in polar snow and their relation to atmospheric chemistry [1995, eng] **F-53510**
HALOE observations of ozone, halogen, nitrogen, and hydrogen compounds made from the UARS Platform [1993, eng] **I-52633**
Heavy metal in the antarctic environment [1992, eng] **E-53243**
Heterogeneous chemistry and kinetics [1994, eng] **I-52323**
Heterogeneous reactions in a stratospheric box model: a sensitivity study [1994, eng] **I-51871**
Heterogeneous reactions in the antarctic stratosphere [1990, eng] **I-53149**
Heterogeneous reactions of $ClONO_2$ HCl, and HOCl on liquid sulfuric acid surfaces [1994, eng] **I-52419**
Hydrate phase equilibria for polar stratospheric clouds [1995, eng] **I-52090**
Hydrogen fluoride transport in the polar stratosphere [1995, eng] **I-53426**
Ice core chemistry: implications for our past atmosphere [1994, eng] **F-52329**
Ice core studies of global biogeochemical cycles [1995, eng] **F-53503**
IGARSS'95. Quantitative remote sensing for science and applications [1995, eng] **F-53476**
Impact of stratospheric aircraft emissions on ozone: a two dimensional model study [1994, eng] **I-53403**
Impact of stratospheric flight on ozone [1995, eng] **I-53644**
Improvements in spectrometer measurements [1994, eng] **I-52398**
Increased atmospheric CO_2 since 1980 [1995, eng] **I-52970**
Increasing greenhouse gases indicate climate changes [1995, eng] **I-53568**
Infrared atmospheric absorption and emission studies [1993, eng] **I-53059**
Infrared optical constants of ice/nitric acid solutions [1994, eng] **I-51869**
Interaction of HCl with amorphous ice [1995, eng] **I-52654**
Interactive formation and growth of sulfate, NAT and ice particles in a photochemical 2D model [1994, eng] **I-52498**
Ionization of chlorine nitrate on ice at 180 K [1995, eng] **I-53311**
Kinetics of the reaction ClO + $ClO=Cl_2O_2$ and its implications for polar ozone depletions [1990, eng] **I-53148**
Laboratory simulation of polar stratospheric cloud formation [1995, eng] **I-53999**
Laboratory studies of heterogeneous reactions [1994, eng] **I-52324**
Lagrangian transport calculations using UARS data. Part II: ozone [1995, eng] **I-53632**
Late Pleistocene climate trajectory [1994, eng] **I-52621**
Latitude variations of stratospheric trace gases [1994, eng] **I-53173**
Latitudinal gradient of atmospheric CO_2 [1995, eng] **I-53210**

Lidar studies of the middle atmosphere structure and dynamics [1994, eng] **I-52998**
Long-term variability of polar stratospheric ozone [1994, eng] **I-52754**
Matrix isolation spectroscopy: technique and applications [1994, eng] **I-52327**
Measurement and analysis of polar stratospheric ClO and N_2O by ground-based mm-wave spectroscopy [1994, eng] **I-53445**
Measurements of CFCs in Antarctica [1994, eng] **I-51739**
Mercury in ancient ice and recent snow from the Antarctic [1995, eng] **F-53512**

Substances deposited on an inland plateau, Antarctica [1994, jpn] F-52568
Summer circulation in the antarctic middle atmosphere [1983, eng] I-53231
Summer tropospheric radiosonde and surface synoptic data at Terra Nova Bay [1994, eng] I-52485
Synoptic origins of precipitation over the Antarctic Peninsula [1995, eng] I-53472
Synoptic-scale cyclones in Antarctica [1994, eng] I-52362
Thermospheric dynamics in the southern polar region [1995, eng] K-53200
Three-dimensional simulation of nitrous oxide transport and antarctic vortex evolution [1994, eng] I-53715
Topographic effect on tropospheric angular momentum [1994, eng] I-52524
Tropical influence on the South Pacific double jet variability [1994, eng] I-52757
Tropospheric hydrogen and carbon oxides in Antarctica and in Greenland [1995, eng] I-52134
Two seasons of hydrogen and carbon monoxide observations at Terra Nova Bay (Antarctica) [1994, eng] I-52491
Verification and effectiveness of a method for long range meteorological forecasting in Antarctica [1990, rus] I-53620
Volcanic signatures in long-term ozone records [1993, eng] I-52801
Wind variation features at Showa and Asuka stations [1994, eng] I-52758
Wind-forced mesoscale cyclone development over the Ross Ice Shelf [1993, eng] I-53072

CURRENTS

Antarctic stratospheric spectroscopy using N$_2$O observations [1995, eng] I-53997
Atmospheric circulation adjacent to a blue ice area, Antarctica [1995, eng] I-52770
Descent of long-lived trace gases in the winter polar vortex [1995, eng] I-53368

- Model of wintertime stratospheric circulation [1995, eng] **I-53998**
- Statistical analyses of katabatic winds in the neighborhood of Terra Nova Bay, Antarctica [1990, eng] **I-52231**
- Turbulence intermittency in the atmospheric surface layer over snow-covered sites [1995, eng] **I-52769**

DENSITY

- Aerosol absorption measurements at Barrow, Mauna Loa and the South Pole [1995, eng] **I-52885**
- Antarctic cloud scattering depth using ground-based radiometry [1995, eng] **I-54000**
- Antarctic ozone hole, UV radiation and phytoplankton [1995, ger] **I-52865**
- Atmospheric ultraviolet irradiance and actinic flux, Antarctica [1995, eng] **I-53377**
- Chlorine monoxide variations in the spring antarctic vortex [1995, eng] **I-53429**
- Efficiency of formation of CH_3O in the reaction of CH_3O_2 with ClO [1995, eng] **I-53048**
- Elements of stratospheric and tropospheric chemistry [1994, eng] **I-52322**
- Evidence for midwinter chemical ozone destruction over Antarctica [1995, eng] **I-53721**
- First results from POAM II: the dissipation of the 1993 antarctic ozone hole [1995, eng] **I-52699**
- Geographical differences in the UV measured by intercompared spectroradiometers [1995, eng] **I-53454**
- Gravity wave activity in the stratosphere and mesosphere at the South Pole [1995, eng] **I-53205**
- Heterogeneous reactions in a stratospheric box model: a sensitivity study [1994, eng] **I-51871**
- Heterogeneous reactions in the antarctic stratosphere [1990, eng] **I-53149**
- Lagrangian transport calculations using UARS data. Part II: ozone [1995, eng] **I-53632**
- Mathematical model of stratospheric polar vortices, part 1 [1995, eng] **I-53391**
- Meteor 3/total ozone mapping spectrometer observations of the 1993 ozone hole [1995, eng] **I-52513**
- Mid stratospheric ozone minima in polar regions [1995, eng] **I-53912**
- Multielemental characterization of aerosols at Terra Nova Bay, summer 1990-1991 [1994, eng] **I-52488**
- Observations of absorbing layers in the antarctic stratosphere in October 1991 [1995, eng] **I-52685**
- Ozone depletion effects on southern ocean biomass [1994, eng] **B-51658**
- Polar atmospheric transmittance decrease due to volcanic aerosols [1993, eng] **I-52052**
- Prevention of ultraviolet radiation damage in antarctic marine invertebrates [1994, eng] **B-52234**
- Reactivity of $ClONO_2$ on $H_2{}^{18}O$ ice and organic liquids [1995, eng] **I-54011**
- Recovery of ozone in the lower stratosphere at the South Pole during the spring of 1994 [1995, eng] **I-53913**
- Role of polar stratospheric clouds in ozone hole chemistry [1994, eng] **I-51855**
- Rotational temperatures from ground-based airglow and aeronomy of the Southern Hemisphere [1995, eng] **K-53203**
- Satellite monitoring of antarctic stratosphere volcanic aerosols [1995, eng] **I-53660**
- Satellite-borne microwave sounding of antarctic ozone hole [1994, eng] **I-51846**
- South Pole 225-GHz atmospheric opacity and water vapor column density [1995, eng] **I-53256**
- Spectroscopy of antarctic stratospheric trace gases [1994, eng] **I-51848**
- Spring 1993—record low antarctic ozone season [1995, eng] **I-52652**
- Springtime chemical variations in polar vortices [1995, eng] **I-53428**
- Stratospheric ClO profiles from McMurdo Station, Antarctica, spring 1992 [1995, eng] **I-52514**
- Stratospheric effects of bromine activation on/in sulfate aerosol [1995, eng] **I-53366**
- Sulfuric acid monohydrate: formation and heterogeneous chemistry in the stratosphere [1995, eng] **I-53691**
- Ultraviolet solar radiation in the high latitudes of South America [1994, eng] **I-52042**
- UVB radiation effects on antarctic marine biomass [1994, eng] **B-52235**

ELECTRICITY

- Atmospheric electric field at Zhongshan Station [1995, chi] **I-53094**
- Balloon measurement of ULF waves above the South Pole [1995, eng] **K-52791**
- Case study of storm commencement and recovery plasmaspheric electric fields near L=2.5 at equinox [1994, eng] **K-52033**
- Feasibility of long-term vertical electric current measurements in the Antarctic [1993, eng] **K-53669**
- Global electrodynamics from superpressure balloons [1995, eng] **K-53208**
- Origin mechanisms of nitrate (NO_3^-) ions in antarctic surface snow [1995, eng] **F-53196**

Case study of storm commencement and recovery plasmaspheric electric fields near *L*=2.5 at equinox [1994, eng] **K-52033**
Chaos and fractal behaviour of the geomagnetic field over polar caps: some preliminary results [1994, eng] **K-52505**
Effect of disturbed-time electric fields on the inner plasmasphere [1994, eng] **K-53384**
Global electrodynamics from superpressure balloons [1995, eng] **K-53208**
Mean thermospheric winds observed from Halley, Antarctica [1994, eng] **K-52031**
Midday recovery of the polar cap absorption of 19-21 March 1990: a case study [1995, eng] **K-52851**
MOF diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya [1994, eng] **K-53612**
Polarisation of whistlers received on the ground near *L*=4 [1994, eng] **K-52095**
Quasi-periodic scintillation events at southern auroral latitudes [1994, eng] **K-53661**
Studies of the inner magnetosphere based on whistler-mode wave data [1993, eng] **K-53258**
Thermospheric dynamics in the southern polar region [1995, eng] **K-53200**
Thermospheric horizontal winds above Mawson, Antarctica [1995, eng] **K-53202**
Upper thermospheric temperatures at South Pole [1995, eng] **K-53201**

Aurora
Auroral absorption drift at Showa Station [1990, eng] **K-52039**
Experimental results of the Polar Patrol Balloon project [1995, eng] **K-53133**
Global electrodynamics from superpressure balloons [1995, eng] **K-53208**
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No.8 [1995, eng] **K-53131**
Thermospheric dynamics in the southern polar region [1995, eng] **K-53200**
Upper thermospheric temperatures at South Pole [1995, eng] **K-53201**
World Data Center C2 for Aurora. Data catalogue No.5 [1995, eng] **K-52372**

DISTRIBUTION
Simultaneous optical and HF radar observations of the ionospheric cusp [1995, eng] **K-53457**

FORMS AND SPECIAL TYPES
Imaging and photometrics of proton aurora dynamics at Showa Station [1995, eng] **K-53132**
Ionospheric phenomena observed at Zhongshan Station [1995, chi] **K-53096**
Pulsating aurora: a review [1995, eng] **K-53992**
Spatial and temporal characteristics of giant undulations [1994, eng] **K-51835**

FREQUENCY
Relationship between the theta aurora and ULF emissions at high latitudes [1994, eng] **K-51987**

INTENSITY
Spatial and temporal characteristics of giant undulations [1994, eng] **K-51835**
Upper atmoshere physics at Showa Station in 1992 [1995, eng] **K-53102**

MORPHOLOGY
Relationship between the theta aurora and ULF emissions at high latitudes [1994, eng] **K-51987**
Spatial and temporal characteristics of giant undulations [1994, eng] **K-51835**

PARTICLES
Circumpolar observation of bremsstrahlung X-rays by a polar patrol balloon over Antarctica [1995, eng] **K-53195**
Processes in the polar cap and magnetosphere in the presence of northern permafrost [1991, rus] **K-54039**
Pulsating aurora: a review [1995, eng] **K-53992**

PHYSICS
Circumpolar observation of bremsstrahlung X-rays by a polar patrol balloon over Antarctica [1995, eng] **K-53195**

RADIO STUDIES
Development of scanning-beam VHF auroral radar system. (Extended abstract) [1995, eng] **K-53134**
Natural low- medium- and high-frequency radio emissions from remote sites [1993, eng] **K-53664**
Radio studies of the Southern Hemisphere high-latitude ionosphere [1995, eng] **K-53207**

VISUAL
Imaging and photometrics of proton aurora dynamics at Showa Station [1995, eng] **K-53132**
Spatial and temporal characteristics of giant undulations [1994, eng] **K-51835**

Auroral zones
Australian antarctic middle and upper atmospheric physics: a new direction [1995, eng] **K-53209**
Circumpolar observation of bremsstrahlung X-rays by a polar patrol balloon over Antarctica [1995, eng] **K-53195**
Comparison of polar stratospheric ozone variations during solar proton events [1993, eng] **I-52802**
Correlation between variations of cosmic noise absorption and near-Earth atmospheric pressure [1994, eng] **K-53613**
Federal Standard 1045 high-frequency radio performance [1994, eng] **G-53538**
High-resolution spectroscopy and electron precipitation [1995, eng] **K-53983**
Mean thermospheric winds observed from Halley, Antarctica [1994, eng] **K-52031**

Natural low- medium- and high-frequency radio emissions from remote sites [1993, eng] K-53664
Origin mechanisms of nitrate (NO_3^-) ions in antarctic surface snow [1995, eng] F-53196
Quasi-periodic scintillation events at southern auroral latitudes [1994, eng] K-53661
Relationship between the theta aurora and ULF emissions at high latitudes [1994, eng] K-51987
SCAR meeting, 22nd, Bariloche, Argentina, June 1992 [1992, eng] K-53226
SCAR meeting, June 1992, Bariloche, Argentina [1992, eng] K-53227
Source of magnetic pulsations (0.1 and 0.4 hertz) at high latitudes [1993, eng] K-53672
Southern ozone hole and auroral activity [1994, eng] I-52503
Vertical winds in the thermosphere within the polar cap [1995, eng] K-52586

Aves
Antarctic birds and seals [1993, eng] B-52883
Antártida, Mar. 1980, No.10 [1980, spa] A-52630
First occurrence of Ratite bird in the Paleogene of Antarctica [1994, eng] E-52211
Flow of matter in Admiralty Bay [1995, eng] B-53006
Life at the margin [1993, dut] B-52181
Palmer long-term ecological research (LTER): An overview of the 1992-1993 season [1993, eng] B-52734
BEHAVIOR
Alternate long and short foraging trips in pelagic seabird parents [1994, eng] B-51974
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] B-52731
Aves nutrition at Crozet Is. [1994, eng] B-52626
Behaviour of seabirds around fishing trawlers in New Zealand subantarctic waters [1995, eng] B-53572
Pelagic communities of seabirds in the South Atlantic Ocean [1995, eng] B-52175
Seabird interactions with fisheries at the South Sandwich Islands and South Georgia [1994, eng] B-52000
BREEDING CYCLES AND REPRODUCTION
Abundance and distribution of bird populations at The Toe and Harmony Point, Nelson Island [1991, spa] B-53608
Alternate long and short foraging trips in pelagic seabird parents [1994, eng] B-51974
Flying birds at Esperanza Bay, Antarctica [1993, eng] B-53351
GEOGRAPHIC DISTRIBUTION
Abundance and distribution of bird populations at The Toe and Harmony Point, Nelson Island [1991, spa] B-53608
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] B-52731
MARKING
Polar news/Notizie polari, Vol.10, No.6 [1995, ita] A-53527
SCAR Working Group on Bird Biology meeting, May 26-27, 1994 [1994, eng] B-54008
MIGRATION
Pelagic communities of seabirds in the South Atlantic Ocean [1995, eng] B-52175
Ratite bird from the Paleogene La Meseta Formation, Seymour Island, Anarctica [1994, eng] E-53370
NUTRITION
Alternate long and short foraging trips in pelagic seabird parents [1994, eng] B-51974
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] B-52731
Aves nutrition at Crozet Is. [1994, eng] B-52626
Behaviour of seabirds around fishing trawlers in New Zealand subantarctic waters [1995, eng] B-53572
PATHOLOGY
Contamination evaluation in fish, seabirds and Weddell seals from Terra Nova Bay [1995, eng] B-52311
PHYSIOLOGY
Alternate long and short foraging trips in pelagic seabird parents [1994, eng] B-51974
Antarctic marine top predators revisited: homeotherms do not leak much CO_2 to the air [1995, eng] B-52364
Structure and function of hemoglobins, enzymes and other proteins [1994, eng] B-52554
POPULATION
Abundance and distribution of bird populations at The Toe and Harmony Point, Nelson Island [1991, spa] B-53608
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] B-52731
Comparison of methods for counting seabirds at sea in the southern ocean [1994, eng] B-51973
Flying birds at Esperanza Bay, Antarctica [1993, eng] B-53351
Pelagic communities of seabirds in the South Atlantic Ocean [1995, eng] B-52175
Seabird interactions with fisheries at the South Sandwich Islands and South Georgia [1994, eng] B-52000
Weddell Sea: a high polar ecosystem [1992, eng] B-53967
SPHENISCIFORMES
Endocrine basis of the reproductive pattern of the Gentoo penguin [1995, eng] B-52881
TAXONOMY
Bird ichnites from the Fildes Peninsula [1994, chi] E-53164

Aves—Anseriformes
BEHAVIOR
Polar news/Notizie polari, Vol.9, No.11 [1994, ita] A-52306
Shag activity levels during chick rearing at Bird I. [1995, eng] B-53015
Stomach contents of the blue-eyed shag from Nelson I. [1995, eng] B-53111
NUTRITION
Shag activity levels during chick rearing at Bird I. [1995, eng] B-53015
Stomach contents of the blue-eyed shag from Nelson I. [1995, eng] B-53111
POPULATION
Shag activity levels during chick rearing at Bird I. [1995, eng] B-53015

Aves—Charadriiformes
Flying birds at Esperanza Bay, Antarctica [1993, eng] B-53351
BEHAVIOR
Avian predation on penguins on King George I. [1995, eng] B-53514
Chick loss in the Falklands skua [1995, eng] B-52577
BREEDING CYCLES AND REPRODUCTION
Breeding biology of the sheathbill *Chionis alba* on South Shetland Is. [1993, spa] B-53606
Breeding chronology and success of the Antarctic Skua on Magnetic I. [1994, eng] B-53127
Chick loss in the Falklands skua [1995, eng] B-52577
ECOLOGY
Breeding biology of the sheathbill *Chionis alba* on South Shetland Is. [1993, spa] B-53606
Population dynamics of south polar skuas in Larsemann Hills [1995, chi] B-53945
Seabird studies at Svarthamaren, Dronning Maud Land [1994, eng] B-52606
EMBRYOLOGY
Breeding biology of the sheathbill *Chionis alba* on South Shetland Is. [1993, spa] B-53606
GEOGRAPHIC DISTRIBUTION
Breeding chronology and success of the Antarctic Skua on Magnetic I. [1994, eng] B-53127
NUTRITION
Diet of the south polar skua on Ross I. [1995, eng] B-53417
Stomach flushing techniques in studies of diet in seabirds [1994, spa] B-52816
Stomach-flushing technique to obtain stomach content samples in antarctic seabirds [1993, spa] B-53607
Upwelling-generated plankton strandlines as food source for seabirds at South Georgia [1995, eng] B-53598
PATHOLOGY
Preliminary survey for coccidian parasites in the birds at Cape Bird, Ross Island [1993, eng] B-52263
POPULATION
Population dynamics of south polar skuas in Larsemann Hills [1995, chi] B-53945

Aves—Procellariiformes
Flying birds at Esperanza Bay, Antarctica [1993, eng] B-53351
Seabirds as sea-surface temperature monitors [1995, eng] B-53970
BEHAVIOR
Adrenalcortical response to stress in petrels [1994, eng] B-52080
Avian predation on penguins on King George I. [1995, eng] B-53514
Brooding and incubation behavior of the antarctic petrel [1995, eng] B-53811
Diets and dietary segregation of sooty albatrosses on Marion I. [1995, eng] B-52309
Diving depths of white-chinned petrels [1994, eng] B-52996
Egg size and early nestling growth in the Snow Petrel [1995, eng] B-53372
Influence of reproductive success on breeding frequency in four southern petrels [1995, eng] B-53705
Regulation of parental investment in the petrel *Thalassoica antarctica* [1995, eng] B-52339

Snow petrel breeding biology at Roberts Knoll [1989, eng] B-52081
BLOOD AND CIRCULATION
Heart rate and oxygen consumption of the albatross *Diomedea melanophrys* [1994, eng] B-53807
BREEDING CYCLES AND REPRODUCTION
Breeding biology of the antarctic prion [1994, eng] B-52520
Brooding and incubation behavior of the antarctic petrel [1995, eng] B-53811
Egg size and early nestling growth in the Snow Petrel [1995, eng] B-53372
Fur seal and seabird studies at Seal I. during the 1992-1993 summer [1993, eng] B-52732
Influence of reproductive success on breeding frequency in four southern petrels [1995, eng] B-53705
Physiological aspects of stomach-oil formation in antarctic seabirds [1993, eng] B-52262
Recording of Wilson's Storm Petrels *(Oceanites oceanicus)* from the Weddell Sea [1994, spa] B-52813
Regulation of parental investment in the petrel *Thalassoica antarctica* [1995, eng] B-52339
Seabird studies at Svarthamaren, Dronning Maud Land [1994, eng] B-52606
Snow petrel breeding biology at Roberts Knoll [1989, eng] B-52081
Wandering albatross and longline fishing [1994, eng] B-52171
ECOLOGY
Egg size and early nestling growth in the Snow Petrel [1995, eng] B-53372
Food and feeding ecology of the white-chinned petrel in South Georgia [1995, eng] B-53838
GEOGRAPHIC DISTRIBUTION
Recording of Wilson's Storm Petrels *(Oceanites oceanicus)* from the Weddell Sea [1994, spa] B-52813
MARKING
Ageing immature Black-browed and Gray-headed albatrosses using moult, bill and plumage characteristics [1994, eng] B-53714
MORPHOLOGY
Ageing immature Black-browed and Gray-headed albatrosses using moult, bill and plumage characteristics [1994, eng] B-53714
Taxonomy of petrels related to vocalizations [1995, eng] B-52576
NUTRITION
Breeding biology of the antarctic prion [1994, eng] B-52520
Diet of the Pintado Petrel at King George I., 1990-1991 [1994, eng] B-54004
Diets and dietary segregation of sooty albatrosses on Marion I. [1995, eng] B-52309
Diving depths of white-chinned petrels [1994, eng] B-52996
DMS as a foraging cue for antarctic Procellariiforms [1995, eng] B-54034

UV radiation effects on aquatic organisms [1993, eng] **B-53985**
UV radiation on King George Island during the ozone depletion of 1992 [1994, spa] **B-52153**
Variation in the lipid content and composition of krill at South Georgia [1995, eng] **B-52452**
Vertical distribution of phytoplankton biomass in the South Atlantic Ocean (Feb.-Apr.) [1993, rus] **B-53779**
Volatile compounds in meromictic lakes and basins [1994, eng] **B-52443**
Volatile fatty and dissolved free amino acids in Organic Lake, Vestfold Hills, East Antarctica [1994, eng] **B-51768**
Water column and sea-ice primary production during Austral spring in the Bellingshausen Sea [1995, eng] **B-53854**
Water column transformations of nitrogen in Lake Bonney [1993, eng] **B-53049**

Biogeography

Antarctic Biology Meeting, 2nd, Padova, Feb. 26-28, 1992. Proceedings [1994, eng] **B-52539**
Arthropoda from Sør Rondane Mountains, with biogeographical notes [1995, eng] **B-53110**
Cretaceous and Paleogene biogeography and the reconstruction of Gondwanaland [1994, chi] **E-53170**
New trigonioid bivalves from the Albian (Early Cretaceous) of Alexander I. [1995, eng] **E-52591**
Origins and biogeography of Cretaceous/Tertiary biserial planktonic foraminifera [1993, eng] **E-52244**

PHYTOGEOGRAPHY

Angiosperm-dominated woody vegetation of Antarctica: a review [1995, eng] **E-53253**
Benthic marine algal flora of South Georgia [1994, eng] **B-53650**
Early Late Permian palynostratigraphy and palaeo-biogeography of Vestfjella, Dronning Maud Land, Antarctica [1995, eng] **E-52993**
Evolution of the antarctic marine benthic algal flora [1994, eng] **B-52378**
Evolution of the glossopterid gymnosperms from Permian Gondwana [1994, eng] **E-52884**
Fossil wood of Seymour I., La Meseta Formation, Antarctica [1994, spa] **E-52152**
New discoveries of plant fossils on Snow I. [1995, spa] **E-53189**
Palynological investigation of the Byers Group on Livingston I. [1994, eng] **E-52428**
Palynology of the Mackellar Formation (Beacon Supergroup) of East Antarctica [1994, eng] **E-51821**
Taxonomy of *Achnanthes* from freshwater maritime antarctic lakes [1994, eng] **B-53249**
Triassic wood from the Gordon Valley [1995, eng] **E-53713**

ZOOGEOGRAPHY

Antarctic zoobenthos [1994, eng] **B-52794**
Antarctica's place in Gondwanaland [1992, eng] **E-53078**
Eocene tardigrade (Mammalia, Xenarthra) from Seymour I. [1995, eng] **E-53958**
Kerguelen Miocene marine fauna [1994, fre] **E-53081**
Marine littoral and coastal Collembola on the subantarctic Macquarie Island [1994, eng] **B-52856**
Mesozoic terrestrial vertebrates, including a scavenging theropod, from the Transantarctic Mountains [1993, eng] **E-51676**
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] **B-52548**
New Eocene crab (Crustacea, Decapoda) from Seymour Island, Antarctica [1995, eng] **E-53466**
Oplegnathid fish from the Eocene of Antarctica [1995, eng] **E-52788**
Planktonic community in the Pacific sector of the Antarctic in February-March 1992 [1994, eng] **B-52698**
Sex-specific and latitudinal variance in postnatal growth of the subantarctic fur seal [1994, eng] **B-52472**
Summer zooplankton community at South Georgia: biomass, vertical migration and grazing [1995, eng] **B-52595**

Biological specimens

MAPS AND CHARTS
Bryozoan communities in the Ross Sea [1990, eng] B-53894
Check-list of antarctic and circumantarctic Demospongiae [1991, eng] B-53877
Copepods collected by the Italian expedition of 1987-1988 [1990, eng] B-53902
Demosponges from Terra Nova Bay, 1987-1990 [1994, eng] B-52809
Ecology of phytoplankton [1990, eng] B-53889
Electrophoretic patterns of sarcoplasmatic proteins of some antarctic fish [1990, eng] B-53898
Environmental impact assessment at sea [1990, eng] A-53899
Feeding and ecology of fish near Elephant I., winter 1986 [1994, eng] B-53248
Italian expedition in the Ross Sea, 1987-1988 [1990, eng] J-53884
Italian expedition in the Ross Sea, 1987-1988, Part II [1990, eng] B-53900
Italian expedition in the South Pacific, 1989-1990, pt.1 [1991, eng] J-53869
Italian expeditions in the Ross Sea, 1987-1988 and 1989-1990 [1994, eng] B-52806
Littoral benthic communities of Terra Nova Bay: sampling data report [1991, eng] B-53878
Marine microflora in Terra Nova Bay [1990, eng] B-53887
Microzooplanktonic populations in Terranova Bay (Ross Sea) [1990, eng] B-53890
Phytobenthos sampling in Terra Nova Bay, 1989-1990 [1991, eng] B-53881
Phytoplankton ecology in the Ross Sea [1990, eng] J-53901
Phytoplankton ecology: species density in the Ross Sea, 1987-1988 [1994, eng] B-52807
Primary production and picoplankton C assimilation in the Ross Sea (Antarctica) [1990, eng] B-53888
Primary production in the southern ocean [1991, eng] B-53876
Quantitative and functional studies of the Terra Nova Bay benthos [1991, eng] B-53880
Report on planktic Ostracoda from the Ross Sea, Antarctica [1990, eng] B-53905
Seasonal and diel changes in the abundance and vertical distribution of 5 copepod species from Croker Passage [1993, eng] B-52854
Shallow and deep-sea bivalve molluscs from Terra Nova Bay [1994, eng] B-52808
Study of copepods from Terra Nova Bay [1990, eng] B-53903
Terra Nova Bay benthos studies [1990, eng] B-53893
Terrestrial ecology of Danco Coast [1995, spa] B-53963
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] B-52853
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] B-53891

MODELS
Antarctic marine top predators revisited: homeotherms do not leak much CO_2 to the air [1995, eng] B-52364
Assimilation and egestion of algal lipid by antarctic krill [1995, eng] B-52749
Bio-optical model of sea-ice algal growth [1994, eng] B-51703
Blood protein in an antarctic fish [1984, eng] B-52818
Economics of antarctic minke whale catches: sustainability and welfare considerations [1994, eng] A-51719
Effects of parasitism on the management of the crab fishery around South Georgia [1994, eng] B-52003
Estimating confidence intervals for fish stock abundance estimates from trawl surveys [1994, eng] A-52005
Growth of the antarctic fishes. A review [1994, eng] B-52217
Modelling krill recruitment [1994, eng] B-51994
Morphological view on potential niches for exobiology on Mars [1995, eng] B-53717
Ozone depletion effects on southern ocean biomass [1994, eng] B-51658
Preliminary model of krill fishery behaviour in Subarea 48.1 [1994, eng] A-51996
Reproductive effort in antarctic mosses [1994, eng] B-52035
Setting the annual krill catch limit to a fixed fraction of the krill biomass estimate [1994, eng] A-51997
Simulation model of the antarctic krill population [1993, rus] A-53791
Studies on antarctic euphausiids [1993, eng] B-52997
Study of the diel rhythm of feeding in the antarctic copepod, *Calanus propinquus* [1991, eng] B-53728
Wandering albatross and longline fishing [1994, eng] B-52171

Birds
See: Aves

Botany
Bacterial distribution in soils and plants of King George I. [1995, eng] B-52366
Botanical studies on Livingston Island [1989, eng] B-51961
Lipids of *Deschampsia antarctica* [1994, eng] B-52423
New significance for antarctic plant collections and cryptogam taxonomy [1993, eng] B-52346
Size structure of tussocks of *Deschampsia antarctica* from Robert I. [1994, eng] B-52155
Soluble carbohydrates and polyols as plant cryoprotectants [1993, eng] B-53272
Stem and leaf study of *Colobanthus quitensis* (Kunth) Bartl. from King George I. [1994, spa] B-52154
Temperature effects of passive greenhouse apparatus in high-latitude climate change experiments [1995, eng] B-53328

Polar stratospheric clouds as deduced from MLS and CLAES measurements [1995, eng] **I-53456**
Preservation of Miocene glacier ice in Antarctica [1995, eng] **E-53214**
Quasi-biennial oscillation in total ozone: global ground-based measurements [1994, eng] **I-53404**
Quaternary geology and climate of the Fildes Peninsula [1991, ger] **E-52969**
Radiative and temperature effects of ozone in the global atmosphere of the 80's [1994, eng] **I-53400**
Rapid oscillations in Vostok and GRIP ice cores [1995, eng] **I-53724**
Recent progress in Vostok ice core analysis: paleoclimate and paleoenvironment [1995, jpn] **I-53835**
Recent variations in mean temperature and the diurnal temperature range in the Antarctic [1995, eng] **I-53192**
Reconciling Late Ordovician (440 Ma) glaciation with very high (14X) CO_2 levels [1995, eng] **I-52089**
Recovery of ozone in the lower stratosphere at the South Pole during the spring of 1994 [1995, eng] **I-53913**
Reef drowning due to sea-level rise during the last deglaciation [1995, eng] **J-52228**
Remote sensing of snow and ice and its relevance to climate change processes [1994, eng] **F-52049**
Response of cryosphere to global warming and reduced rise in sea level [1994, chi] **F-52236**
Role of Antarctica in forcing circumpolar circulations [1994, eng] **I-52087**
Satellite monitoring of antarctic stratosphere volcanic aerosols [1995, eng] **I-53660**
Satellite remote sensing of polar snow and ice: present status and future directions [1995, eng] **F-52973**
Sea ice role in climate sensitivity, pt.1 [1995, eng] **F-52831**
Sea ice thickness changes and their relation to climate [1994, eng] **F-51879**
Sea-ice dynamics and CO_2 sensitivity in a global climate model [1994, eng] **I-51705**
Simulation of polar microarthropod response to global warming [1994, eng] **B-51830**
Simulation of the mesocyclonic activity in the Ross Sea, Antarctica [1995, eng] **I-53373**
Snow accumulation rate from synthesis of microwave and altimeter data [1995, eng] **F-53597**
Snow on sea ice: competing effects in shaping climate [1991, eng] **F-51867**
Some problems on the research of astronomical theory of ice age [1994, chi] **I-52233**
Southern Indian Ocean detrital input changes [1994, eng] **J-52622**
Southern ocean interglacial comparisons from benthic assemblages [1994, eng] **J-52044**
Southern ocean: biogeochemical cycles and climate changes [1994, eng] **B-51692**
Spring 1993—record low antarctic ozone season [1995, eng] **I-52652**
Study of the paleoclimate in polar regions using deep ice cores from ice sheets [1994, rus] **I-52687**
Synoptic-scale cyclones in Antarctica [1994, eng] **I-52362**
Trends in global distribution of trace gases inferred from polar ice cores [1994, eng] **F-52330**
Two-step shape and timing of the last deglaciation in Antarctica [1995, eng] **I-53041**
Ultraviolet solar radiation in the high latitudes of South America [1994, eng] **I-52042**
Vascular plants as bioindicators of regional warming in Antarctica [1994, eng] **B-52036**

MICROCLIMATES
340 year record of biogenic sulphur from the Weddell Sea area, Antarctica [1995, eng] **F-53495**
Climate at Artigas Station [1989, spa] **I-52963**
Climatological aspects of mesoscale cyclogenesis over the Ross Sea and Ross Ice Shelf regions of Antarctica [1994, eng] **I-51774**
Determination of past winter temperatures at Ellis Fjord from fast ice diatom assemblages [1994, eng] **I-52073**
Ecophysiology of *Usnea antarctica* in the maritime Antarctic. 1. [1995, eng] **B-53463**
Effects of the snow cover on antarctic sea ice [1995, eng] **F-53502**
Influence of the albedo-temperature feed-back on climate sensitivity [1995, eng] **F-53501**
Local climate at Taylor Dome and paleoclimate from ice cores [1994, eng] **F-52923**
Microclimate of mobile buildings in the coastal zone of Antarctica [1994, rus] **G-52690**
Micrometeorological observation over the fast ice at Ongul Strait near Syowa Station [1994, eng] **I-52760**

Modelling mass and energy exchange over polar snow using the DAISY model [1994, eng] **F-52189**
Nanoclimate data from McMurdo Dry Valleys [1993, eng] **I-52149**
Polar stratospheric clouds and atmosphere temperature at McMurdo Station, winter 1992 [1994, eng] **I-52501**
Present situation and prospect of the UV-B climatology in Antarctica [1994, chi] **I-52287**
RACER: Racer Rocks [1993, eng] **A-52715**
Recent sea-ice advances in Baffin Bay/Davis Strait and retreats in the Bellingshausen Sea [1995, eng] **F-53500**
Simulation of polar microarthropod response to global warming [1994, eng] **B-51830**
Synoptic origins of precipitation over the Antarctic Peninsula [1995, eng] **I-53472**
Temperature effects of passive greenhouse apparatus in high-latitude climate change experiments [1995, eng] **B-53328**
Temperature relations of soil protists as an indicator of climatic change [1995, eng] **B-53325**
Thermal belt on the Sôya Coast ice sheet slope and the surface inversion layer over Showa Station [1994, eng] **I-52759**

Clothing
Shadows on the wasteland [1993, eng] **A-52882**

Clouds
Algorithm development and application for ice surface temperature retrieval from satellite data [1994, eng] **F-53084**
Antarctic cloud scattering depth using ground-based radiometry [1995, eng] **I-54000**
Atmospheric Radiation, Tromsø, Norway, June 30-July 1, 1993 [1993, eng] **I-53313**
Classification of MOS-1 VTIR images in the Antarctic, a case study [1994, eng] **I-51883**
Cloud-surface interactions and solar flux at high latitudes [1993, eng] **I-53315**
Comments on "Laboratory simulation of atmospheric motions in the vicinity of Antarctica" [1995, eng] **I-53047**
Comparison of polar stratospheric ozone variations during solar proton events [1993, eng] **I-52802**
Complex refractive indices in the infrared of nitric acid trihydrate aerosols [1995, eng] **I-53914**
Composition and freezing of aqueous H_2SO_4/HNO_3 solutions under polar stratospheric conditions [1994, eng] **I-53285**
Data analysis from the summer expedition of 1992-1993 [1994, spa] **J-51742**
Detection of clouds over polar oceans from AVHRR daylight images [1994, eng] **I-52494**
Detection of polar stratospheric clouds over Antarctica [1995, eng] **I-52974**
Efficiency of formation of CH_3O in the reaction of CH_3O_2 with ClO [1995, eng] **I-53048**
Evidence for midwinter chemical ozone destruction over Antarctica [1995, eng] **I-53721**
Factors influencing cloudiness and sunshine duration at Arctowski Station, 1986-1989 [1994, eng] **I-52216**
Freezing behavior of stratospheric sulfate aerosols inferred from trajectory studies [1995, eng] **I-53193**
FTIR studies of low temperature sulfuric acid aerosols [1995, eng] **I-52848**
Gravity wave activity in the stratosphere and mesosphere at the South Pole [1995, eng] **I-53205**
Growth of nitric acid hydrates on thin sulfuric acid films [1994, eng] **I-53284**
Heterogeneous chemistry and kinetics [1994, eng] **I-52323**
Heterogeneous reactions of $ClONO_2$ HCl, and HOCl on liquid sulfuric acid surfaces [1994, eng] **I-52419**
Hydrate phase equilibria for polar stratospheric clouds [1995, eng] **I-52090**
Ice radiance method for BUV instrument monitoring [1993, eng] **I-52803**
Impact of stratospheric flight on ozone and water vapor [1995, eng] **I-53683**
Infrared optical constants of ice/nitric acid solutions [1994, eng] **I-51869**
Infrared optical properties of clouds over the maritime Antarctic [1993, eng] **I-53317**
Interaction of HCl with amorphous ice [1995, eng] **I-52654**
Interactive formation and growth of sulfate, NAT and ice particles in a photochemical 2D model [1994, eng] **I-52498**
Ionization of chlorine nitrate on ice at 180 K [1995, eng] **I-53311**
Laboratory simulation of polar stratospheric cloud formation [1995, eng] **I-53999**
Laboratory studies of heterogeneous reactions [1994, eng] **I-52324**
Lidar observations of polar stratospheric clouds in Antarctica [1995, chi] **I-53095**
Lidar studies of the middle atmosphere structure and dynamics [1994, eng] **I-52998**
Mapping Antarctic ozone from visible-channel data [1993, eng] **I-52805**
Mapping of surface UV over Antarctica using satellite observations [1993, eng] **I-53316**
Mesoscale temperature fluctuations and polar stratospheric clouds [1995, eng] **I-53423**
Model studies of dynamics, chemistry and transport in the antarctic and arctic stratospheres [1993, eng] **I-53259**
On the friction velocity during blowing snow [1995, eng] **F-52642**
On the lack of southern hemisphere polar mesophere summer echoes [1995, eng] **I-53369**
Ozone abundance, cloud effects, and spectral irradiance [1991, eng] **I-54012**
Ozone and aerosols lidar measurements in 1991 and 1992 in Dumont d'Urville [1994, eng] **I-52499**
Parameterization of the downward long-wave radiation at the Earth's surface in polar regions [1994, eng] **I-52167**
Polar climate studies from space: overview and current issues [1993, eng] **I-53314**
Polar stratospheric cloud study via a remote piloted aircraft [1993, eng] **I-53236**
Polar stratospheric clouds and atmosphere temperature at McMurdo Station, winter 1992 [1994, eng] **I-52501**
Polar stratospheric clouds as deduced from MLS and CLAES measurements [1995, eng] **I-53456**
Radiative effects of clouds, ice sheet and sea ice in the Antarctic [1994, eng] **I-52187**
Reactivity of $ClONO_2$ on $H_2{}^{18}O$ ice and organic liquids [1995, eng] **I-54011**
Refractive index of simulated polar stratospheric cloud films [1994, eng] **I-53375**
Refractive indices of simulated polar stratospheric cloud films [1994, eng] **I-51870**
Report on a workshop on polar atmosphere and hydrosphere comparing satellite data and surface observations [1994, jpn] **I-52572**
Role of polar stratospheric clouds in ozone hole chemistry [1994, eng] **I-51855**
Seasonal variation of atmospheric nitric acid over the South Pole in 1992 [1995, eng] **I-52132**
Seasonal variations of precipitating clouds over Antarctica [1994, eng] **I-51985**
Simulation of polar stratospheric cloud freezing temperatures [1994, eng] **I-51836**
Simulations of the 1979-88 polar climates by global climate models [1995, eng] **I-53486**
Solar proton effects on austral ozone during the final months of 1989 [1994, eng] **I-53405**
Spectroscopic analysis of PSCs [1995, eng] **I-52778**
Spectroscopic studies of PSCs [1994, eng] **I-52326**
Spectroscopy of polar stratospheric cloud model surfaces [1995, eng] **I-52508**
Stratospheric aerosol surface processes in a zonally averaged model [1994, eng] **I-53399**
Stratospheric aircraft and nitric acid trihydrate clouds [1994, eng] **I-53402**
Sulfuric acid monohydrate: formation and heterogeneous chemistry in the stratosphere [1995, eng] **I-53691**
Surface spectroscopy [1994, eng] **I-52325**
Synoptic-scale cyclones in Antarctica [1994, eng] **I-52362**
Temperature dependent CH_3OCl formation in the reaction between CH_3O_2 and ClO [1994, eng] **I-52127**
Ultraviolet solar radiation in the high latitudes of South America [1994, eng] **I-52042**
Unusual PSCs observed by lidar in Antarctica [1995, eng] **I-53720**
Vapor pressures of polar stratospheric cloud solutions [1995, eng] **I-52653**

Coelenterata
Sublittoral fauna of Admiralty Bay [1990, ger] **B-53694**
BEHAVIOR
New antarctic Cretaceous coelenterate [1994, eng] **E-52191**
ECOLOGY
Planktonic cnidarians collected in the Weddell Gyre in summer 1979 [1994, eng] **B-52137**
Population structure and feeding deterrence in three shallow-water antarctic soft corals [1995, eng] **B-53199**
GEOGRAPHIC DISTRIBUTION
New antarctic Cretaceous coelenterate [1994, eng] **E-52191**
Planktonic cnidarians collected in the Weddell Gyre in summer 1979 [1994, eng] **B-52137**

Population structure and feeding deterrence in three shallow-water antarctic soft corals [1995, eng] **B-53199**
MORPHOLOGY
Fossil scleractinian corals from James Ross Basin, Antarctica [1994, eng] **E-52119**
Hard bottom zoobenthos of Terra Nova Bay [1990, eng] **B-53908**
New antarctic Cretaceous coelenterate [1994, eng] **E-52191**
Reef drowning due to sea-level rise during the last deglaciation [1995, eng] **J-52228**
PHYSIOLOGY
Chemical defenses in antarctic soft corals [1995, eng] **B-53653**
Population structure and feeding deterrence in three shallow-water antarctic soft corals [1995, eng] **B-53199**
POPULATION
Planktonic cnidarians collected in the Weddell Gyre in summer 1979 [1994, eng] **B-52137**
Population structure and feeding deterrence in three shallow-water antarctic soft corals [1995, eng] **B-53199**
Zooplankton composition and variation in waters near Great Wall Station [1994, eng] **B-52274**
TAXONOMY
Fossil scleractinian corals from James Ross Basin, Antarctica [1994, eng] **E-52119**
Hard bottom zoobenthos of Terra Nova Bay [1990, eng] **B-53908**
New antarctic Cretaceous coelenterate [1994, eng] **E-52191**

Erebus expedition [1994, fre] **D-53475**
Finnish Antarctic Expedition FINNARP-93
Finland's report to SCAR, Aug. 1994 [1994, eng] **A-52404**
First Netherlands Antarctic Expedition
First Netherlands Antarctic Expedition, 1990-1991 [1992, dut] **D-53136**
GANOVEX V & VI
Biennial report 1989/1990 [1991, ger] **A-53513**
German Antarctic Expedition
Influence of Drygalski on German polar research [1995, ger] **A-52302**
German Expedition GEISHA 1987/88
Logistics of the GEISHA Expedition [1994, eng] **G-52860**
Planning and scientific program of the GEISHA Expedition [1994, eng] **G-52859**
German Expedition GEISHA, 1987/88
Shackleton Range stratigraphy and sediments [1994, eng] **E-52861**
JARE-34
JARE-34 activities in summer 1992-1993 [1994, jpn] **D-52570**
Norway South Pole Expedition 1990
Norway South Pole traverse expedition, 1990 [1991, nor] **D-53138**
Norwegian Antarctic Research Expedition
General report on the 1991/92 NARP expedition [1994, eng] **D-52605**
Operation Deep Freeze
End of season report: Operation Deep Freeze 94/95 [1995, eng] **G-52611**
Operation Order 201. "Operation Deep Freeze" 94/95 [1994, eng] **G-52370**
Second German South Polar Expedition
Filchner's expedition to the Weddell Sea [1994, eng] **D-53635**
Southern Cross
Archaeology of Borchgrevink's stores hut, Cape Adare, Antarctica [1991, eng] **A-53421**
Soviet Antarctic Expedition
Morbidity of wintering-over participants in Soviet antarctic expeditions of 1981-1985 [1992, rus] **H-53593**
Report on the 30th Soviet Antarctic Expedition [1992, rus] **A-53587**
SWEDARP 1992/93
Swedish Antarctic Research Programme 1992/93; a cruise report [1995, eng] **A-52641**
SWEDARP 1993/94
Swedish Antarctic Research Programme 1993/94; a cruise report [1995, eng] **A-52640**
SWEDARP 89/90
Swedish Antarctic Research Programme, 1989/90: a cruise report [1992, eng] **A-54013**
Swedish Antarctic Expedition
Site restoration of the Swedish Expedition, 1901-1903 [1994, spa] **A-53229**
Swedish ITASE Expedition
Sweden's report to SCAR No.7, 1994 [1994, eng] **A-52405**

Exploration methods
Age estimation of fish larvae from otolith microstructure [1995, eng] **B-53933**
Chaos and fractal behaviour of the geomagnetic field over polar caps: some preliminary results [1994, eng] **K-52505**
Comparison of methods for counting seabirds at sea in the southern ocean [1994, eng] **B-51973**
Corridor aerogeophysics in the Interior Ross Embayment of West Antarctica [1994, eng] **E-53025**
Dispersal of algae in southern Victoria Land, 1990-1991 [1991, eng] **B-53820**
Effects of monitoring procedures on Adélie penguins [1994, eng] **B-52001**
Electrochemical and spectroscopic procedures in sea water chemistry [1995, eng] **J-52981**
Equipment and methods used during Italian marine geophysical explorations, 1987-1990 [1993, eng] **L-51765**
Estimating confidence intervals for fish stock abundance estimates from trawl surveys [1994, eng] **A-52005**
Intravenous blood extracting method in penguins [1995, eng] **B-53964**
Modelling krill recruitment [1994, eng] **B-51994**
Multielemental characterization of aerosols at Terra Nova Bay, summer 1990-1991 [1994, eng] **I-52488**
Ozone abundance, cloud effects, and spectral irradiance [1991, eng] **I-54012**
Polar excavation techniques and technology [1989, eng] **A-53422**
Seismic signal enhancement of antarctic crustal data [1993, eng] **L-51758**
Signal/noise ratio enhancement of seismic profiles in the Ross Sea (Antarctica) [1993, eng] **L-51757**
Telepresence in the human exploration of Mars: field studies in analog environments [1993, eng] **A-53813**
Ties to harbour bases for drift, scale and datum determination in antarctic marine gravity profiles [1993, eng] **L-51763**
Use of PCR for detection of ammonium-oxidizing bacteria in water samples [1995, eng] **B-53836**

Explorers and scientists
Antarctica: Brazilian expeditions [1989, eng] **A-52693**
Antarctica: the extraordinary history of man's conquest of the frozen continent [1990, eng] **A-52160**
Queen Maud Land, Antarctica [1994, nor] **A-53240**

Firn
Antarctic field measurements of radar backscatter from snow [1995, eng] F-52613
Extent and duration of antarctic surface melting [1994, eng] F-52634
IGARSS'95. Quantitative remote sensing for science and applications [1995, eng] F-53476
Trends in global distribution of trace gases inferred from polar ice cores [1994, eng] F-52330

CHEMISTRY
Chemical and isotopic firn properties on Berkner I. [1994, eng] F-52936
Local climate at Taylor Dome and paleoclimate from ice cores [1994, eng] F-52923
Near-surface firn from the Ronne Ice Shelf [1994, eng] F-52908
Nitric acid in firn: discussion [1995, eng] F-53509
Post depositional effects on HCl, HNO_3, and organic acids in polar firn [1995, eng] F-53511
Recent survey of brine infiltration in McMurdo Ice Shelf, Antarctica [1994, eng] F-52922

CORES
Chemical and isotopic firn properties on Berkner I. [1994, eng] F-52936

CRYSTALS
Accumulation variation in eastern Kemp Land, Antarctica [1994, eng] F-52920
Crystal fabrics of firn/ice cores from shallow boreholes on Nelson Ice Cap, Antarctica [1994, chi] F-51747

DENSITY
Bubble volumes in firn-ice transition layers of ice cores [1994, eng] F-52904
Empirical relation between overburden pressure and firn density [1994, eng] F-52903
Method for determining ice-thickness change at remote locations using GPS [1994, eng] F-52930
Microwave emission from polar firn [1994, eng] F-53703

ELECTRICAL PROPERTIES
Electrical resistivity sounding of the East Antarctic ice sheet [1995, eng] F-52509

STRATIGRAPHY
Characterization of antarctic firn by means of ERS-1 scatterometer measurements [1995, eng] F-53484
Chemical and isotopic firn properties on Berkner I. [1994, eng] F-52936
Microwave emission from polar firn [1994, eng] F-53703
Near-surface firn from the Ronne Ice Shelf [1994, eng] F-52908
Photometric analysis of a 100 m ice core from Asuka Camp [1994, eng] F-52290
Recent survey of brine infiltration in McMurdo Ice Shelf, Antarctica [1994, eng] F-52922
Transformation rate from air bubbles to air-hydrate crystals in ice sheets [1994, eng] F-52911
Variations of snow chemistry on the Filchner-Ronne Ice Shelf [1994, eng] F-52933

STRUCTURE
Microwave emission from polar firn [1994, eng] F-53703

SURFACE FEATURES
Near-surface firn from the Ronne Ice Shelf [1994, eng] F-52908

TEMPERATURE
Local climate at Taylor Dome and paleoclimate from ice cores [1994, eng] F-52923
Near-surface firn from the Ronne Ice Shelf [1994, eng] F-52908

VARIATIONS
In-situ dielectric constant of polar firn revisited [1995, eng] F-53331

First aid

80 year record of retreat of the Koettlitz Ice Tongue, McMurdo Sound, Antarctica [1994, eng] F-52926
Velocities of Pine Island Glacier, West Antarctica, from ERS-1 SAR images [1995, eng] F-53497
Velocities of the Smith Glacier tongue and Dotson Ice Shelf [1994, eng] F-52905

CHEMISTRY
Geochemical study on the Strandline Glacier, Terra Nova Bay, Antarctica [1993, eng] F-52978
Palmer LTER: Hydrogen peroxide in the Palmer LTER region. III. Local sources and sinks [1993, eng] J-52744

CORES
Glacier geophysical studies at Taylor Dome: year three [1993, eng] F-51793
Marine ice formation in a floating ice tongue [1995, eng] F-52706

DENSITY
New device for the measurement of air content in polar ice [1995, eng] F-53642

DISTRIBUTION
Glacial-ice fragments in antarctic sea ice [1995, eng] F-53643
Ice sheet-bed rock interaction on the continental margins [1989, rus] F-52150

DRILLING
Temperature distribution in Collins Ice Cap, King George I. [1995, chi] F-53097

FLOW
20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] F-52950
Automatic tracking of crevasses on satellite images [1995, eng] F-53103
Basal friction of Ice Stream E, West Antarctica [1995, eng] F-53639
Climate of the penultimate ice age: a study of an antarctic ice core [1994, eng] I-51986
Coastal-change and glaciological maps of Antarctica [1995, eng] F-53498
Dynamics of the Ross Ice Shelf [1991, eng] F-52538
Fast glacier flow over soft beds [1995, eng] F-51857
Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] F-52951

Glacier disequilibrium in the Convoy Range, Transantarctic Mountains, Antarctica [1994, eng] **F-52931**
Glacier geophysical studies at Taylor Dome: year three [1993, eng] **F-51793**
Glaciological data collected by JARE-30, 31 and 32, 1989-1991 [1995, eng] **F-52800**
Glaciological studies on Nelson Island, South Shetland Islands, Antarctica [1995, eng] **F-53641**
Interhemispheric correlation of Late Pleistocene glacial events [1995, eng] **E-53616**
Investigating tidal flexure on an ice shelf using kinematic GPS [1994, eng] **F-52946**
NNSS and GPS monitor very slow ice motion [1986, eng] **F-53383**
No ice-sheet collapse [1993, eng] **F-51743**
Physics of glaciers. 3rd edition [1994, eng] **F-52422**
Role of the margins in the dynamics of an active ice stream [1994, eng] **F-52635**
Study on glacier movement using satellite SAR and visible/near-IR imagery [1994, eng] **F-51851**
Velocities of Pine Island Glacier, West Antarctica, from ERS-1 SAR images [1995, eng] **F-53497**
Velocities of the Smith Glacier tongue and Dotson Ice Shelf [1994, eng] **F-52905**

FORMATION
Interaction of katabatic winds and the formation of blue-ice areas in East Antarctica [1995, eng] **F-53640**

HEAT EXCHANGE
20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] **F-52950**
Calculation of multi-year mass balance variations on small dome of Collins Ice Cap, King George Island [1994, chi] **F-51731**
Physics of glaciers. 3rd edition [1994, eng] **F-52422**
Temperature distribution in Collins Ice Cap, King George I. [1995, chi] **F-53097**

MASS BALANCE
Calculation of multi-year mass balance variations on small dome of Collins Ice Cap, King George Island [1994, chi] **F-51731**
Climate, mass balance and glacial changes on a small dome of the Collins Ice Cap [1994, eng] **F-51727**
Dynamics of Cook Glacier, Ile de Kerguelen [1994, fre] **F-52531**
Gamma-ray detector for in-situ radioactivity measurement in snowfields [1994, eng] **F-52868**
Glacier disequilibrium in the Convoy Range, Transantarctic Mountains, Antarctica [1994, eng] **F-52931**
Interaction of katabatic winds and the formation of blue-ice areas in East Antarctica [1995, eng] **F-53640**
Investigating tidal flexure on an ice shelf using kinematic GPS [1994, eng] **F-52946**
Measurement and modelling of local surface energy balance of the Ecology Glacier [1995, eng] **F-53471**
Velocities of Pine Island Glacier, West Antarctica, from ERS-1 SAR images [1995, eng] **F-53497**

MECHANICAL PROPERTIES
Basal friction of Ice Stream E, West Antarctica [1995, eng] **F-53639**
Ice sheet-bed rock interaction on the continental margins [1989, rus] **F-52150**
Physics of glaciers. 3rd edition [1994, eng] **F-52422**
Sensitive and robust strain-meter for ice studies [1994, eng] **G-52603**
Subrecent moraine ridge formation on Cuff Cape, Victoria Land, Antarctica [1995, eng] **E-53104**
Why calculated basal drags of ice streams can be fallacious [1995, eng] **F-52790**

MORPHOLOGY
20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] **F-52950**
Alpine valley heads on the Antarctic Peninsula [1995, eng] **E-52752**
Glacial history of the area between the David and Mawson glaciers [1994, eng] **F-52898**
Glaciological studies on Nelson Island, South Shetland Islands, Antarctica [1995, eng] **F-53641**
Recent advance of the grounding line of Lambert Glacier [1994, eng] **F-52896**
Subglacial topography in the Sør Rondane Mountains [1995, eng] **F-53697**

PHYSICAL PROPERTIES
Physics of glaciers. 3rd edition [1994, eng] **F-52422**
Refractive-index measurements of natural air-hydrate crystals in an antarctic ice sheet [1995, eng] **F-53830**

RADIOACTIVITY
Gamma-ray detector for in-situ radioactivity measurement in snowfields [1994, eng] **F-52868**

SEISMIC EXPLORATION
Sea-bed depths at the mouth of Rutford Ice Stream, Antarctica [1994, eng] **F-52943**

SOUNDINGS
Glacial history of the area between the David and Mawson glaciers [1994, eng] **F-52898**
Glacier geophysical studies at Taylor Dome: year three [1993, eng] **F-51793**
Radar sounding and study of the bedrock topography on Collins Ice Cap [1994, chi] **F-51732**
Radio echo sounding on Strandline Glacier, Terra Nova Bay (Antarctica) [1993, eng] **F-51761**
Recent elevation increase on Lambert Glacier [1994, eng] **F-52893**
Subglacial topography in the Sør Rondane Mountains [1995, eng] **F-53697**

STRATIGRAPHY
Glaciological studies on Nelson Island, South Shetland Islands, Antarctica [1995, eng] **F-53641**

STRUCTURE
Detection of crevasses near McMurdo Station, Antarctica with airborne short-pulse radar [1995, eng] **F-53174**
Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] **F-52951**
Glacial-ice fragments in antarctic sea ice [1995, eng] **F-53643**
New device for the measurement of air content in polar ice [1995, eng] **F-53642**
Physics of glaciers. 3rd edition [1994, eng] **F-52422**
Preservation of Miocene glacier ice in Antarctica [1995, eng] **E-53214**

SURFACE FEATURES
Automatic tracking of crevasses on satellite images [1995, eng] **F-53103**
Coastal-change and glaciological maps of Antarctica [1995, eng] **F-53498**
Exploration of C-band σ° dependence on azimuth angle over antarctic sea and glacial ice [1995, eng] **F-53481**
Extent and duration of antarctic surface melting [1994, eng] **F-52634**
Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] **F-52951**
Measurement and modelling of local surface energy balance of the Ecology Glacier [1995, eng] **F-53471**
Meteorites as time markers on antarctic blue ice fields [1995, eng] **E-54009**
Recent advance of the grounding line of Lambert Glacier [1994, eng] **F-52896**
Recent elevation increase on Lambert Glacier [1994, eng] **F-52893**
Satellite imagery of glacier variation on James Ross I. [1995, eng] **F-53499**

TEMPERATURE
Artificially compacted snow and temperature regime in a glacier active layer [1992, rus] **F-53595**
Climate, mass balance and glacial changes on a small dome of the Collins Ice Cap [1994, eng] **F-51727**
Temperature distribution in Collins Ice Cap, King George I. [1995, chi] **F-53097**

TERMINOLOGY
Antarctic snow and ice sciences glossary [1982, jpn] **F-53631**

THAWING
Temperature distribution in Collins Ice Cap, King George I. [1995, chi] **F-53097**
Transport of suspended particulate matter in an antarctic fjord [1994, eng] **J-51984**
Two-step shape and timing of the last deglaciation in Antarctica [1995, eng] **I-53041**

THICKNESS
Glacial history of the area between the David and Mawson glaciers [1994, eng] **F-52898**
Investigating tidal flexure on an ice shelf using kinematic GPS [1994, eng] **F-52946**
Predictions of vertical uplift caused by changing polar ice volumes on a viscoelastic earth [1995, eng] **E-52701**
Radar sounding and study of the bedrock topography on Collins Ice Cap [1994, chi] **F-51732**
Radio echo sounding on Strandline Glacier, Terra Nova Bay (Antarctica) [1993, eng] **F-51761**

- Sea-bed depths at the mouth of Rutford Ice Stream, Antarctica [1994, eng] **F-52943**

VARIATIONS

- ^{14}C age corrections in antarctic lake sediments inferred from geochemistry [1994, eng] **E-52221**
- 20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] **F-52950**

Report of "Workshop on the Glaciological Technology in Polar Regions" [1995, jpn] **F-53701**
Use of drilling by the U.S. Antarctic Program [1994, eng] **A-52661**

ELECTRICAL PROPERTIES
C axes from radar depolarization experiments at Upstream B Camp [1994, eng] **F-52915**
Electrical conductivity dating of the Byrd Station ice core [1994, eng] **F-52907**
Electrical resistivity measurements on Ice Stream B, Antarctica [1994, eng] **F-52909**
Ice-sheet radio-echo internal reflections and ice dielectric properties [1994, eng] **F-52902**
Reflection amplitudes of 40 MHz monopulse radar sounding [1994, eng] **F-52292**

EXCAVATIONS
Polar excavation techniques and technology [1989, eng] **A-53422**

FLOW
Flow in the transition zone between an ice sheet and an ice shelf [1994, eng] **F-52900**
Ice-stream mechanics [1993, eng] **F-51790**
Sedimentation by the antarctic ice sheet from a glaciological perspective [1994, eng] **F-51888**
Seismic sequences of the Ross Sea continental margin (Antarctica) [1993, eng] **E-51755**
Swedish Antarctic Research Programme 1993/94; a cruise report [1995, eng] **A-52640**
Temperature measurements in the margin of ice stream B, 1992-1993 [1993, eng] **F-51792**

FORMATION
Composition and freezing of aqueous H_2SO_4/HNO_3 solutions under polar stratospheric conditions [1994, eng] **I-53285**
Crystal fabrics of firn/ice cores from shallow boreholes on Nelson Ice Cap, Antarctica [1994, chi] **F-51747**
Freezing behavior of stratospheric sulfate aerosols inferred from trajectory studies [1995, eng] **I-53193**
FTIR studies of low temperature sulfuric acid aerosols [1995, eng] **I-52848**
Growth process of air-hydrates and diffusion of air molecules in deep ice sheet [1994, eng] **F-52763**
Interactive formation and growth of sulfate, NAT and ice particles in a photochemical 2D model [1994, eng] **I-52498**
Melting and freezing beneath ice shelves and ocean circulation [1994, eng] **F-52953**
Refractive index of simulated polar stratospheric cloud films [1994, eng] **I-53375**

Seasonal changes of sea-ice characteristics off East Antarctica [1994, eng] F-52919
Simulation of polar stratospheric cloud freezing temperatures [1994, eng] I-51836

HEAT EXCHANGE
Climate and ice-snow cover [1992, chi] I-53910
Proceedings [1995, eng] F-53485
Satellite imagery of glacier variation on James Ross I. [1995, eng] F-53499
Surface energy balance of antarctic snow and blue ice [1995, eng] F-52537

INSTRUMENTS
Airborne radio echo sounding on the Evans flowline, Ronne Ice Shelf [1994, eng] F-52293
Algorithm development and application for ice surface temperature retrieval from satellite data [1994, eng] F-53084
Bedrock topography by mobile radio echo sounder in Queen Maud Land [1994, eng] F-52764
Dynamics of the Ross Ice Shelf [1991, eng] F-52538
Extracts from the official report "Ice radar digital recording, data processing and results from the Lambert Glacier Basin traverses" [1995, eng] F-53246
Hot water drilling to the ocean beneath Ekström Ice Shelf [1994, eng] F-52906
Ice core hot-fluid drilling [1994, eng] F-52566
Ice-screw system for anchoring test equipment on to ice [1994, eng] G-52604
Microprocessor based ice-radar system for surface profiling [1992, eng] G-53534
Microwave scatterometry on antarctic ice shelves [1994, eng] G-52407
New device for the measurement of air content in polar ice [1995, eng] F-53642
New German ice drill [1994, eng] F-52580
Non-destructive high resolution density measurements of the B15 ice core [1994, eng] F-52296
Oceanographic and glaciological investigations in Queen Maud Land, 1991-1992 [1994, eng] F-52607
Radar studies and mapping under the Riiser-Larsen Ice Shelf [1994, eng] F-52610
Remote sensing of antarctic ice shelves (Extended abstract) [1989, eng] F-53382
Report of "Workshop on the Glaciological Technology in Polar Regions" [1995, jpn] F-53701
Seismic investigation of the Larsen Ice Shelf [1995, eng] F-52840
Sensitive and robust strain-meter for ice studies [1994, eng] G-52603
South Pole ice optics [1995, eng] F-52416
Spectral bidirectional reflectance of snow and glacier ice [1994, eng] F-52889
Vertical temperature profile of ice stream B [1993, eng] F-51791

MAPS AND CHARTS
20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] F-52950
80 year record of retreat of the Koettlitz Ice Tongue, McMurdo Sound, Antarctica [1994, eng] F-52926
Algorithm development and application for ice surface temperature retrieval from satellite data [1994, eng] F-53084
Antarctic sea ice analysis, 1991-1992 [1992, eng] F-53637
CASERTZ 1991-1992: airborne gravity and surface topography measurement [1993, eng] L-51662
Changes and surface features of the Larsen Ice Shelf [1994, eng] F-52890
Coastal-change and glaciological maps of Antarctica [1995, eng] F-53498
Demonstration project to supply near real time sea ice information [1994, eng] F-54023
Detailed elevation map of Ice Stream C [1994, eng] F-52939
Detection of clouds over polar oceans from AVHRR daylight images [1994, eng] I-52494
Development of enhanced ice flow at the southern margin of Ice Stream D, Antarctica [1994, eng] F-52937
Digital elevation model of the antarctic ice sheet [1994, eng] F-52897
Drift of a giant tabular berg in the antarctic seas [1992, eng] F-51826
Elevation data of a satellite-image map of Filchner-Ronne Ice Shelf [1994, eng] F-52942
Evaluation of strain rates on Ice Stream B by GPS measurements [1994, eng] F-52929
Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] F-52951
Glacial history of the area between the David and Mawson glaciers [1994, eng] F-52898
Glacier disequilibrium in the Convoy Range, Transantarctic Mountains, Antarctica [1994, eng] F-52931
Glaciological data collected by JARE-30, 31 and 32, 1989-1991 [1995, eng] F-52800
High-resolution radar on Ice Stream B2 [1994, eng] F-52913
IGARSS'95. Quantitative remote sensing for science and applications [1995, eng] F-53476
Interaction between antarctic sea ice and ENSO events [1994, eng] F-52761
Landsat TM image maps of the Shirase and Siple Coast ice streams, West Antarctica [1994, eng] F-52952
Mapping ice front changes of Müller Ice Shelf, Antarctic Peninsula [1995, eng] F-52842
Numerical modelling of Filchner-Ronne Ice Shelf [1994, eng] F-52298
Oceanic remote sensing and sea ice monitoring [1994, eng] F-54020
Proceedings [1994, eng] F-52888
Proceedings [1995, eng] F-53485
Radar studies and mapping under the Riiser-Larsen Ice Shelf [1994, eng] F-52610
Radio echo sounding on Strandline Glacier, Terra Nova Bay (Antarctica) [1993, eng] F-51761
Recent advance of the grounding line of Lambert Glacier [1994, eng] F-52896
Sailing directions for Antarctica, 1992 [1992, eng] C-53364
Satellite altimetry and ice thickness measurements, Ross Ice Shelf [1994, eng] F-52944
Satellite imagery of glacier variation on James Ross I. [1995, eng] F-53499
Satellite microwave observations of antarctic firn surface state [1993, eng] F-53262
Satellite retrieval of temperature profiles over sea ice [1995, eng] I-53483
Sea ice formation and bottom water outflow in the Weddell Sea [1995, eng] F-53478
Snow and ice characteristics of the Bellingshausen Sea, during the spring melt [1995, eng] F-53845
Studies of the grounding-line location on Ice Streams D and E, Antarctica [1994, eng] F-52895
Study on the oscillation relationship between sea ice of the Arctic and Antarctic [1994, eng] F-52762
Subglacial topography and Cenozoic glacial erosion and tectonic evolution of Victoria Land [1994, eng] E-51950
Subglacial topography in the Sør Rondane Mountains [1995, eng] F-53697
Surveying and mapping program of the United States in Antarctica [1993, eng] C-53675
Technique of continuous analysis of sea ice distribution using video images taken from a ship [1994, eng] F-52765
Temperature structure and polynyas in the Cosmonaut Sea [1994, eng] F-52935
Thickness and bed topography of Upstream B from radar sounding [1994, eng] F-52912

MECHANICAL PROPERTIES
Ice-screw system for anchoring test equipment on to ice [1994, eng] G-52604
Ice-stream mechanics [1993, eng] F-51790
Physics of ice: a bibliography [1993, eng] A-52385

MODELS
Age determination by numerical modelling of ice core from King George I. [1994, chi] F-51748
Atmospheric forcing of sea ice models [1994, eng] F-51880
Basal friction of Ice Stream E, West Antarctica [1995, eng] F-53639
Bubble volumes in firn-ice transition layers of ice cores [1994, eng] F-52904
Climate change detection from satellite sensing of polar sea ice [1995, eng] F-53480
Climate sensitivity of antarctic blue-ice areas [1995, eng] F-53493
Climate, the antarctic ice sheet and ground heat flux [1995, eng] F-53491
Decay of surface topography on the Ross Ice Shelf, Antarctica [1994, eng] F-52928
Development of enhanced ice flow at the southern margin of Ice Stream D, Antarctica [1994, eng] F-52937
Effects of the snow cover on antarctic sea ice [1995, eng] F-53502
Ekström grounding line experiments—first results [1994, eng] F-52299
Electrical resistivity measurements on Ice Stream B, Antarctica [1994, eng] F-52909
Empirical relation between overburden pressure and firn density [1994, eng] F-52903
Filchner-Ronne Ice Shelf Programme, Report No.8 (1994) [1994, eng] F-52291
Flow in the transition zone between an ice sheet and an ice shelf [1994, eng] F-52900

Ionosphere
AGONET (Antarctic Geospace Observatory Network) program [1994, eng] **K-52504**
Australian antarctic middle and upper atmospheric physics: a new direction [1995, eng] **K-53209**
Case study of storm commencement and recovery plasmaspheric electric fields near L=2.5 at equinox [1994, eng] **K-52033**
First automatic geophysical observatory installed on the polar plateau [1993, eng] **K-53663**
Global electrodynamics from superpressure balloons [1995, eng] **K-53208**
High-resolution spectroscopy and electron precipitation [1995, eng] **K-53983**
Observations of solar- terrestrial physics in Antarctica [1994, chi] **K-52286**
Polar cap field-aligned currents for southward interplanetary magnetic fields [1994, eng] **K-51828**
Polarisation of whistlers received on the ground near L=4 [1994, eng] **K-52095**
Proceedings of the NIPR Symposium on Upper Atmosphere Physics, No.8 [1995, eng] **K-53131**
Radio observation data at Syowa Station, Antarctica during 1993 [1995, eng] **K-53224**
Radio studies of the Southern Hemisphere high-latitude ionosphere [1995, eng] **K-53207**
Research of neutral winds in the polar lower thermosphere using radar techniques [1993, eng] **I-52100**
Satellite Experiments Simultaneous with Antarctic Measurements (SESAME) [1995, eng] **K-52976**
Simultaneous two hemisphere observations of the presence of polar patches in the nightside ionosphere [1994, eng] **K-52034**
Upper atmoshere physics at Showa Station in 1992 [1995, eng] **K-53102**

ABSORPTION
Auroral absorption drift at Showa Station [1990, eng] **K-52039**

CURRENT SYSTEMS
Comparative study on the ionospheric current systems in the Antarctic and Arctic regions [1994, eng] **K-51721**
Feasibility of long-term vertical electric current measurements in the Antarctic [1993, eng] **K-53669**
Interplanetary sources of geomagnetic activity at high latitudes [1994, spa] **K-52815**
Optical measurements of ion drift from South Pole Station [1993, eng] **K-53670**
Studies of ionospheric convection in the Southern Hemisphere using long-duration balloons [1993, eng] **K-53674**

D REGION
Geomagnetic time and position of a terrestrial station [1990, eng] **K-53389**
Showa Station MF radar experiment in upper middle atmosphere studies [1995, eng] **K-53135**
Spaced antenna and interferometric measurements [1995, eng] **I-53560**
Springtime reduction in MF mesospheric echo occurrence [1995, eng] **K-53722**

DIURNAL VARIATIONS
Absorption and geomagnetic processes in the polar ionosphere [1994, spa] **K-52014**
Effect of disturbed-time electric fields on the inner plasmasphere [1994, eng] **K-53384**
IMF effects in the appearance of slant E conditions (SEC) in the northern and southern polar regions [1995, eng] **K-53708**
Ionospheric plasma convection in the Southern Hemisphere [1995, eng] **K-52850**
MOF diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya [1994, eng] **K-53612**
Springtime reduction in MF mesospheric echo occurrence [1995, eng] **K-53722**
Thermospheric horizontal winds above Mawson, Antarctica [1995, eng] **K-53202**
Tidal oscillations of the winter mesopause over Amundsen-Scott Station [1994, eng] **K-52991**

DRIFT
Optical measurements of ion drift from South Pole Station [1993, eng] **K-53670**
Simultaneous optical and HF radar observations of the ionospheric cusp [1995, eng] **K-53457**

E REGION
Antarctic mesospheric dynamics [1992, eng] **K-53309**
Development of scanning-beam VHF auroral radar system. (Extended abstract) [1995, eng] **K-53134**
High latitude atmospheric tidal behavior [1989, eng] **K-53388**
Ionospheric phenomena observed at Zhongshan Station [1995, chi] **K-53096**

ELECTRON DENSITY
Analysis of the ionospheric anomaly at Great Wall Station, Antarctica [1994, eng] **K-52279**
Analysis of the ionospheric anomaly over Great Wall Station, Antarctica [1994, chi] **K-51749**

Ground based radar investigation of the antarctic mesosphere [1995, eng] **K-53206**
IMF effects in the appearance of slant E conditions (SEC) in the northern and southern polar regions [1995, eng] **K-53708**
Mean thermospheric winds observed from Halley, Antarctica [1994, eng] **K-52031**
Measurement of high-energy particle concentrations in the tropical, middle and polar latitude stratosphere [1992, rus] **K-53556**
Quasi-periodic scintillation events at southern auroral latitudes [1994, eng] **K-53661**
Relativistic solar proton events [1995, eng] **K-53579**
Showa Station MF radar experiment in upper middle atmosphere studies [1995, eng] **K-53135**
Studies of the inner magnetosphere based on whistler-mode wave data [1993, eng] **K-53258**

F REGION
Analysis of the ionospheric anomaly at Great Wall Station, Antarctica [1994, eng] **K-52279**
Analysis of the ionospheric anomaly over Great Wall Station, Antarctica [1994, chi] **K-51749**
Effect of disturbed-time electric fields on the inner plasmasphere [1994, eng] **K-53384**
Ionospheric phenomena observed at Zhongshan Station [1995, chi] **K-53096**
MOF diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya [1994, eng] **K-53612**
New mechanism for polar patch formation [1994, eng] **K-51829**
Optical measurements of ion drift from South Pole Station [1993, eng] **K-53670**
Polar lacuna on ionograms. I: Brief morphology [1994, eng] **K-53385**
Thermospheric observations from Halley Station [1995, eng] **K-52620**

IONIZATION
Geomagnetic time and position of a terrestrial station [1990, eng] **K-53389**
Ground based radar investigation of the antarctic mesosphere [1995, eng] **K-53206**
IMF effects in the appearance of slant E conditions (SEC) in the northern and southern polar regions [1995, eng] **K-53708**
Ionospheric phenomena observed at Zhongshan Station [1995, chi] **K-53096**
Measurement of high-energy particle concentrations in the tropical, middle and polar latitude stratosphere [1992, rus] **K-53556**
Quasi-periodic scintillation events at southern auroral latitudes [1994, eng] **K-53661**
Springtime reduction in MF mesospheric echo occurrence [1995, eng] **K-53722**
Thermospheric dynamics in the southern polar region [1995, eng] **K-53200**

IRREGULARITIES
Analysis of the ionospheric anomaly at Great Wall Station, Antarctica [1994, eng] **K-52279**
Analysis of the ionospheric anomaly over Great Wall Station, Antarctica [1994, chi] **K-51749**
Balloon measurement of ULF waves above the South Pole [1995, eng] **K-52791**
IMF effects in the appearance of slant E conditions (SEC) in the northern and southern polar regions [1995, eng] **K-53708**
MOF diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya [1994, eng] **K-53612**
Polar lacuna on ionograms. I: Brief morphology [1994, eng] **K-53385**

Benthic marine algal flora of South Georgia [1994, eng] B-53650
Bio-optical model of sea-ice algal growth [1994, eng] B-51703
Biogenic hydrocarbons in particulate material of the Bellingshausen Sea marginal ice zone [1995, eng] J-53851
Biogenic production of dimethyl sulfide: krill grazing [1993, eng] B-52260
Biology of the southern ocean [1994, eng] B-52573
Biosiliceous sedimentation patterns for the Indian Ocean during the last 45 million years [1992, eng] E-52111
Boletín Antártico Chileno, Vol.13, No.2 [1994, spa] A-52392
Chemical defense of an antarctic nudibranch and its prey [1994, eng] B-52777
Chemical defenses in antarctic soft corals [1995, eng] B-53653
Chemical ecology of marine invertebrates in McMurdo Sound [1993, eng] B-52256
Chemical ecology of sponges from McMurdo Sound [1993, eng] B-52257
Chlorophyll variations in Weddell Sea microplankton [1993, eng] B-52118
Coastal marine ecosystem research at Showa Station [1994, eng] B-52569
Communities of epibiota on two erect species of antarctic bryozoa [1994, eng] B-52136
Comparison of antioxidant defence and pro-oxidant processes in antarctic and Mediterranean scallops [1995, eng] B-52990
Comparison of methods for counting seabirds at sea in the southern ocean [1994, eng] B-51973
Contamination evaluation in fish, seabirds and Weddell seals from Terra Nova Bay [1995, eng] B-52311
Controls on antarctic sea ice biological communities [1994, eng] J-51832
Copepoda (Cyclopoida) from the Croker Passage (Antarctica, June-August, 1989) [1993, eng] B-53087
Cretaceous/Tertiary boundary in the southern Indian Ocean [1992, eng] E-52109
Demosponges from Terra Nova Bay, 1987-1990 [1994, eng] B-52809
Diet of *Trematomus newnesi* Boulenger, 1902, from Terra Nova Bay [1995, eng] B-52312
Differential scanning calorimetry in ecophysiological research [1994, eng] B-53711
Dimethyl sulfide concentrations near the Antarctic Peninsula: November 1992 [1993, eng] B-52255
Distribution and composition of phytoplankton in Ardly Bay (King George Island, Antarctica) [1993, eng] B-52117
Diurnal vertical migration of antarctic macroplankton [1994, eng] B-52125
Diving behavior of Emperor Penguins nurturing chicks at Coulman Island, Antarctica [1995, eng] B-53014
Early growth and milk composition in southern elephant seals (*Mirounga leonina*) [1994, eng] B-52458
Early Pliocene diatom assemblages from the Larsemann Hills [1995, eng] E-52319
Ecological significance of the sea ice biota [1994, eng] F-51689
Ecology of phytoplankton [1990, eng] B-53889
Ecophysiology of polar algae [1995, eng] B-52872
Ecophysiology of *Usnea antarctica* in the maritime Antarctic. 1. [1995, eng] B-53463
Ecosystem variability in antarctic seas [1993, rus] J-53766
Effects of heat shock and UV-B radiation on temperate and antarctic diatoms [1995, eng] B-53082
Effects of organic materials on the growth of subantarctic marine bacteria [1994, eng] B-52588
Energy contents and organic constituents in brown algae [1995, eng] B-53934
Environmental impact assessment at sea [1990, eng] A-53899
Environments of inlets, coves and lagoons in Admiralty Bay [1994, eng] J-52215
Epibiotic communities on sublittoral macroinvertebrates at Signy Island, Antarctica [1995, eng] B-53755
Evolution of the antarctic marine benthic algal flora [1994, eng] B-52378
Expedition ANTARKTIS-XI/2 of RV *Polarstern* in 1993/94 [1995, ger] E-52536
Feeding of dominant species of antarctic zooplankton in summer [1993, rus] B-53805
First quantitative data on Terra Nova Bay coastal soft bottom bivalve molluscs [1994, eng] B-52812
First quantitative data on Terra Nova Bay coastal soft bottom polychaetes [1994, eng] B-52811
Foraminifera from the surface sediments in the Great Wall Bay [1994, chi] B-53167
Fossil marine bivalves from the Great Wall Bay [1994, chi] E-53168
Future of antarctic science—biosphere [1994, eng] B-51701
Heat shock response of an antarctic alga is evident at 5°C [1994, eng] B-51975
Human contamination of Arthur Harbor and McMurdo Sound [1995, eng] J-53548
Hydrocarbon content of an antarctic infaunal bivalve [1995, eng] B-52834
Hydrocarbon record of marine sediment core from Lützow-Holm Bay, Antarctica [1995, eng] E-53010
Hydrocarbons and sterols in marine sediments and soils at Davis Station [1995, eng] B-52835
Hydrophysical structure of the Second Frontal Zone [1993, rus] J-53765
Icefish stock surveys in South Georgia, 1975-1992 [1993, eng] B-53350
In situ experimental study of young sea ice formation on an antarctic lead [1995, eng] F-52465
Indian Ocean framework for paleoceanographic synthesis based on DSDP and ODP results [1992, eng] E-52113
Induction of MFO activity in the antarctic fish *Pagothenia bernacchii*: preliminary results [1995, eng] B-52779
Inevitable consequences of large-scale krill fishing in the Antarctic [1993, rus] A-53790
Interannual variability in the Elephant I. surface waters in summer [1993, eng] J-52733
Italian expedition in the Ross Sea, 1987-1988 [1990, eng] J-53884
Italian expedition in the Ross Sea, 1987-1988, Part II [1990, eng] B-53900
Italian expedition in the South Pacific, 1989-1990, pt.1 [1991, eng] J-53869
Italian expeditions in the Ross Sea, 1987-1988 and 1989-1990 [1994, eng] B-52806
JARE-34 activities in summer 1992-1993 [1994, jpn] D-52570
Krill winter home in Gerlache Strait [1994, eng] B-52643
Life forms in antarctic sea ice [1995, eng] J-53046
Life forms in antarctic sea ice [1992, ger] F-53695
Lipid biochemistry of antarctic copepods [1995, eng] B-53752
Littoral benthic communities of Terra Nova Bay: sampling data report [1991, eng] B-53878
Long-term dynamics of phytoplankton biomass in the Commonwealth Sea during summers 1977-1988 [1993, rus] B-53776

Antarctic automatic weather stations: austral summer 1992-1993 [1993, eng] I-53076
ARIES Project: satellite imagery of the Antarctic [1994, eng] G-52345
Atmospheric composition measurements by a satellite microwave sounder [1995, eng] I-53479
Australian antarctic lidar facility [1994, eng] G-53474
Australian antarctic middle and upper atmospheric physics: a new direction [1995, eng] K-53209
Classification of MOS-1 VTIR images in the Antarctic, a case study [1994, eng] I-51883
Conference proceedings of the Italian Research on Antarctic Atmosphere, Vol.45 [1994, eng] I-52482
Counting condensation nuclei in the antarctic ozone mission [1994, eng] I-52958
Development of international co-operative studies of polar meteorology [1992, eng] I-51824
Early results of validation and application of CLAES data [1994, eng] I-53016
Episodic events in the antarctic atmospheric boundary layer [1993, eng] I-53067
Experimental results of the Polar Patrol Balloon project [1995, eng] K-53133
Glaciological data collected by JARE-34, 1993 [1995, eng] F-52799
HALOE observations of ozone, halogen, nitrogen, and hydrogen compounds made from the UARS Platform [1993, eng] I-52633
High-resolution ultraviolet spectral irradiance monitoring program in polar regions [1993, eng] I-53679
Ice radiance method for BUV instrument monitoring [1993, eng] I-52803
Improved ozone spectrometers [1994, eng] I-52397
Improvements in spectrometer measurements [1994, eng] I-52398
Infrared radiometer for ozone column density measurements [1994, eng] I-52497
JARE-32 meteorological observations at Showa and Asuka stations in 1991 [1994, jpn] I-52571
Katabatic winds across Ross Ice Shelf [1993, eng] I-52144
Katabatic winds along the Transantarctic Mountains [1993, eng] I-52143
Kernlose winter in Adélie Coast [1993, eng] I-52146
Low-level atmospheric jets and inversions on Ice Station Weddell 1 [1993, eng] I-53068
Mapping Antarctic ozone from visible-channel data [1993, eng] I-52805
Measurement of gas phase and particulate matter tropospheric components in Antarctica [1994, eng] I-52489
Measurements of CFCs in Antarctica [1994, eng] I-51739
Meteorological data at Showa Station, 1993 [1994, eng] I-52600
Micrometeorological observation over the fast ice at Ongul Strait near Syowa Station [1994, eng] I-52760
Monthly mean climatic data for antarctic automatic weather stations [1993, eng] I-52140
Nature of katabatic winds at Terra Nova Bay [1993, eng] I-52142
New PC-based real time system to analyze sodar echoes [1994, eng] I-52495
Observational study of the 93 "Ozone Hole" at Zhongshan Station, Antarctica [1995, eng] I-53654
Ozone and aerosols lidar measurements in 1991 and 1992 in Dumont d'Urville [1994, eng] I-52499
Ozone concentrations from measurements of solar UV radiation [1994, eng] I-52829
Polar news/Notizie polari, Vol.10, No.4 [1995, ita] A-52959
Polar Ozone and Aerosol Measurement experiment (POAM II) [1994, eng] I-53473
Polar Patrol Balloon [1994, eng] G-52102
Polar stratospheric cloud study via a remote piloted aircraft [1993, eng] I-53236
Radiometric profiler for antarctic atmospheric profiling [1994, eng] I-51852
Relative elevations of meteorological facilities at South Pole Station [1993, eng] I-53066
Sensible and latent heat flux estimates in Antarctica [1993, eng] I-52145
South Pole 225-GHz atmospheric opacity and water vapor column density [1995, eng] I-53256
Spaced antenna and interferometric measurements [1995, eng] I-53560
Statistical analyses of katabatic winds in the neighborhood of Terra Nova Bay, Antarctica [1990, eng] I-52231
Summer circulation in the antarctic middle atmosphere [1983, eng] I-53231

Surface meteorological data at Great Wall Station, Antarctica 1988-1992 [1993, eng] I-51709
Surface meteorological data at Zhongshan Station, Antarctica 1989-1992 [1994, eng] I-51708
Use of Brewer #035 and #050 in Antarctica [1994, eng] I-52502

MAPS AND CHARTS
Antarctic automatic weather station data for the calendar year 1993 [1995, eng] I-52601
Antarctic automatic weather stations: austral summer 1992-1993 [1993, eng] I-53076
Antarctic circulation in the Universities' Global Atmospheric Modelling Project (UGAMP) model [1993, eng] I-53260
Antarctic surface temperature and pressure data [1989, eng] I-53573
Atmospheric composition measurements by a satellite microwave sounder [1995, eng] I-53479
Biological and chemical studies in Terra Nova Bay [1991, eng] J-53872
Case study of turbulent parameters during the antarctic winter [1995, eng] I-53960
Data analysis from the summer expedition of 1992-1993 [1994, spa] J-51742
Decline in polar stratospheric ozone as observed by NOAA infrared sounders [1993, eng] I-52804
Detection of clouds over polar oceans from AVHRR daylight images [1994, eng] I-52494
Distribution of nutrients in the Terra Nova Bay and in the Ross Sea [1990, eng] J-53886
Glaciological data collected by JARE-30, 31 and 32, 1989-1991 [1995, eng] F-52800
Glaciological data collected by JARE-34, 1993 [1995, eng] F-52799
Hydrological characteristics of Terra Nova Bay [1990, eng] J-53885
Ice radiance method for BUV instrument monitoring [1993, eng] I-52803
Infrared radiometer for ozone column density measurements [1994, eng] I-52497
Katabatic winds across Ross Ice Shelf [1993, eng] I-52144
Local climate, circulation and surface-energy balance of an antarctic blue-ice area [1994, eng] F-52914
Mapping Antarctic ozone from visible-channel data [1993, eng] I-52805
Measurement and analysis of polar stratospheric ClO and N_2O by ground-based mm-wave spectroscopy [1994, eng] I-53445
Mesoscale diagnostic numerical modelling for complex topography [1994, eng] I-52484
Meteorological data at Showa, Mizuho and Asuka Stations, 1961-1993 [1995, eng] I-53191
Meteorological data at Showa Station, 1993 [1994, eng] I-52600
Midtropospheric subsynoptic-scale cyclone over the Ross Sea and Ross Ice Shelf [1995, eng] I-52843
New PC-based real time system to analyze sodar echoes [1994, eng] I-52495
Oceanographic data from JARE-33, Nov. 1991-Mar. 1992 [1995, eng] J-53130
Polar Ozone and Aerosol Measurement experiment (POAM II) [1994, eng] I-53473
Sailing directions for Antarctica, 1992 [1992, eng] C-53364
Southern ozone hole and auroral activity [1994, eng] I-52503
Summer tropospheric radiosonde and surface synoptic data at Terra Nova Bay [1994, eng] I-52485
Surface meteorological data at Great Wall Station, Antarctica 1988-1992 [1993, eng] I-51709
Surface meteorological data at Zhongshan Station, Antarctica 1989-1992 [1994, eng] I-51708
Thermal belt on the Sôya Coast ice sheet slope and the surface inversion layer over Showa Station [1994, eng] I-52759
Total ozone trends in the Southern Hemisphere: an update [1993, eng] I-53652
Use of Brewer #035 and #050 in Antarctica [1994, eng] I-52502
Wind variation features at Showa and Asuka stations [1994, eng] I-52758

MODELS
Accuracy of profile retrievals from mm-wave spectra of ClO and N_2O [1994, eng] I-51849
Analytic expression for chemical composition of stratospheric aerosols [1995, eng] I-53453
Antarctic circulation in the Universities' Global Atmospheric Modelling Project (UGAMP) model [1993, eng] I-53260
Antarctic moisture flux and net accumulation from global atmospheric analyses [1995, eng] I-53492
Antarctic slope winds and the polar stratospheric vortex [1994, eng] I-53662
Arctic and antarctic precipitation simulations [1995, eng] I-53487
Associations between antarctic katabatic flow and the upper level winter vortex [1995, eng] I-52320
Atmospheric forcing of sea ice models [1994, eng] F-51880
Atmospheric longwave radiation and temperature profiles at Amundsen-Scott Station [1993, eng] I-53065
Atmospheric outflow in near coastal regions on a climatological scale [1994, eng] I-52487
BrO + ClO reaction and the polar stratospheric ozone [1990, eng] I-53147
Chemical composition of ancient atmospheres: a model study constrained by ice core data [1995, eng] I-53430
Climate and ice-snow cover [1992, chi] I-53910
Climate drift in a global ocean general circulation model [1995, eng] J-53645
Climatology of the SKYHI troposphere-stratosphere-mesosphere general circulation model [1995, eng] I-52183
Closing off the southern ocean surface [1995, eng] I-52517
Comments on "Laboratory simulation of atmospheric motions in the vicinity of Antarctica" [1995, eng] I-53047
Composition and freezing of aqueous H_2SO_4/HNO_3 solutions under polar stratospheric conditions [1994, eng] I-53285
Descent of long-lived trace gases in the winter polar vortex [1995, eng] I-53368
Dispersion properties of the flow in the southern stratosphere during winter and spring [1995, eng] I-53424
Early results of validation and application of CLAES data [1994, eng] I-53016
ECMWF analyses and predictions of the surface climate of Greenland and Antarctica [1995, eng] I-53996
Effect of external and internal factors on mean latitudinal temperature of Antarctica [1994, rus] I-52688
Efficiency of formation of CH_3O in the reaction of CH_3O_2 with ClO [1995, eng] I-53048
Episodic events in the antarctic atmospheric boundary layer [1993, eng] I-53067
General circulation model study of ozone depletion, 1980-1990 [1994, eng] I-53406
Global effects of greenhouse gas concentration constraint [1995, eng] I-52131
Global increase of SF_6 observed in the atmosphere [1994, eng] I-52987
Growth of nitric acid hydrates on thin sulfuric acid films [1994, eng] I-53284
Heterogeneous reactions in a stratospheric box model: a sensitivity study [1994, eng] I-51871
Impact of greenhouse effect on polar cryosphere [1995, eng] I-52459
Impact of stratospheric aircraft emissions on ozone: a two dimensional model study [1994, eng] I-53403
Impact of stratospheric flight on ozone [1995, eng] I-53644
Impact of stratospheric flight on ozone and water vapor [1995, eng] I-53683
Increasing greenhouse gases indicate climate changes [1995, eng] I-53568
Influence of the albedo-temperature feed-back on climate sensitivity [1995, eng] F-53501
Interaction of katabatic winds and the formation of blue-ice areas in East Antarctica [1995, eng] F-53640
Interactive formation and growth of sulfate, NAT and ice particles in a photochemical 2D model [1994, eng] I-52498
Ionization of chlorine nitrate on ice at 180 K [1995, eng] I-53311
Joint investigations of the Middle Pliocene climate. I: PRISM paleoenvironmental reconstructions [1994, eng] I-51989
Katabatic wind forcing on the antarctic circumpolar easterlies [1993, eng] I-53075
Kinetics of the reaction ClO + $ClO=Cl_2O_2$ and its implications for polar ozone depletions [1990, eng] I-53148
Laboratory simulation of polar stratospheric cloud formation [1995, eng] I-53999
Last two glacial-interglacial cycles simulated by the LLN model [1994, eng] I-52421
Mapping Antarctic ozone from visible-channel data [1993, eng] I-52805
Mathematical model of stratospheric polar vortices, part 1 [1995, eng] I-53391
Mesoscale diagnostic numerical modelling for complex topography [1994, eng] I-52484
Mesoscale modeling study of the atmospheric circulation of high southern latitudes [1995, eng] I-52659
Mid stratospheric ozone minima in polar regions [1995, eng] I-53912
Model of Greenland and antarctic ice sheet thickness variations [1995, eng] F-53693
Model of wintertime stratospheric circulation [1995, eng] I-53998
Model response to increasing atmospheric CO_2 [1994, eng] I-52682
NCAR CCM2 simulation of the modern antarctic climate [1994, eng] I-51837

On the relevance of the methane oxidation cycle to "ozone hole" chemistry [1994, eng] **I-52204**
Origin of present-day antarctic precipitation from surface snow deuterium excess data [1995, eng] **I-53692**
Ozone abundance, cloud effects, and spectral irradiance [1991, eng] **I-54012**
Ozone depletion effects on southern ocean biomass [1994, eng] **B-51658**
Ozone in the troposphere and stratosphere. Part 1 [1994, eng] **I-53395**
Paleoclimatic CO_2 record related to changes in oceanic thermohaline circulation [1995, eng] **I-53868**
Parameterization of the downward long-wave radiation at the Earth's surface in polar regions [1994, eng] **I-52167**
Predicting the Vostok CO_2 curve [1995, eng] **F-53732**
Proceedings [1995, eng] **F-53485**
Radiative and temperature effects of ozone in the global atmosphere of the 80's [1994, eng] **I-53400**
Reactivity of $ClONO_2$ on $H_2{}^{18}O$ ice and organic liquids [1995, eng] **I-54011**
Recent variations in mean temperature and the diurnal temperature range in the Antarctic [1995, eng] **I-53192**
Reconciling Late Ordovician (440 Ma) glaciation with very high (14X) CO_2 levels [1995, eng] **I-52089**
Reconstructed model of trace gases vertical distribution [1995, eng] **I-53681**
Refractive index of simulated polar stratospheric cloud films [1994, eng] **I-53375**
Role of Antarctica in forcing circumpolar circulations [1994, eng] **I-52087**
Satellite data compared to field observations of stratospheric trace gases during spring of 1992 [1993, eng] **I-53061**
Sea ice role in climate sensitivity, pt.1 [1995, eng] **F-52831**
Sea-ice dynamics and CO_2 sensitivity in a global climate model [1994, eng] **I-51705**
Sea-level rise: a review of recent past and near-future trends [1995, eng] **J-52977**
Simulation of stratospheric trace chemical constituents [1995, eng] **I-53427**
Simulation of the mesocyclonic activity in the Ross Sea, Antarctica [1995, eng] **I-53373**
Simulations of the 1979-88 polar climates by global climate models [1995, eng] **I-53486**
South Pole 225-GHz atmospheric opacity and water vapor column density [1995, eng] **I-53256**
Spectroscopy of polar stratospheric cloud model surfaces [1995, eng] **I-52508**
Springtime chemical variations in polar vortices [1995, eng] **I-53428**
Stratospheric aerosol surface processes in a zonally averaged model [1994, eng] **I-53399**
Stratospheric aircraft and nitric acid trihydrate clouds [1994, eng] **I-53402**
Stratospheric effects of bromine activation on/in sulfate aerosol [1995, eng] **I-53366**
Stratospheric water vapor annual cycle [1995, eng] **I-53682**
Sulfuric acid monohydrate: formation and heterogeneous chemistry in the stratosphere [1995, eng] **I-53691**
Summer surface winds in the Siple Coast confluence zone, West Antarctica [1993, eng] **I-53070**
Temperature dependent CH_3OCl formation in the reaction between CH_3O_2 and ClO [1994, eng] **I-52127**
Temperature effects of passive greenhouse apparatus in high-latitude climate change experiments [1995, eng] **B-53328**
Theoretical model of atmospheric ozone depletion [1995, eng] **I-52793**
Three-dimensional simulation of nitrous oxide transport and antarctic vortex evolution [1994, eng] **I-53715**
Topographic effect on tropospheric angular momentum [1994, eng] **I-52524**
Tropical influence on the South Pacific double jet variability [1994, eng] **I-52757**

Polar news/Notizie polari, Vol.10, No.5 [1995, ita] A-53141
Preliminary study on freshwater diatom flora from King George Island, Antarctica [1994, chi] E-53166
Proximal sub ice-shelf sedimentation, Jutulgryta, East Antarctica [1994, eng] F-52608
Radiocarbon ages of molluscan shell fossils along the east coast of Lützow-Holm Bay [1995, eng] E-53009
Ratite bird from the Paleogene La Meseta Formation, Seymour Island, Anarctica [1994, eng] E-53370
Reevaluation of a Late Eocene fossil teleost [1995, eng] E-52526
Reply to comment on "Cretaceous-Tertiary boundary transition" [1994, eng] E-52411
Reptilian fossils found near Coalsack Bluff [1995, eng] E-53380
Some Late Cretaceous plants from King George Island, Antarctica [1994, chi] E-53157
Stable isotope palaeotemperatures and the evolution of high palaeolatitude climate in the Cretaceous [1993, eng] E-53265
Stratigraphy and palaeontology of Fildes Peninsula, King George Island, Antarctica [1994, chi] E-53153
Studies of Cainozoic environmental change in Tasmania and coastal Antarctica: a review [1993, eng] F-51864
Taxonomy of a fossil mollusc [1995, eng] E-53829
Upper Cretaceous calcareous nannoplankton from the *Pecten* Conglomerate on Cockburn I. [1994, eng] E-52669
Upper Jurassic methane-seep limestone from the Fossil Bluff Group forearc basin of Alexander Island, Antarctica [1995, eng] E-52986

Parasites
Additional new cestodes from antarctic batoids [1991, eng] B-53242
Air-breathing littoral mites of sub-Antarctic South Georgia [1995, eng] B-53839
Communities of epibiota on two erect species of antarctic bryozoa [1994, eng] B-52136
Description of three endocommensal ciliates from sea urchins in the Weddell Sea [1994, chi] B-51751
Effects of parasitism on the management of the crab fishery around South Georgia [1994, eng] B-52003
Genetics and ecology of the nematode endoparasites *Contracaecum* and *Pseudoterranova* in the polar regions [1994, eng] B-52552
Isozyme variation and taxonomic rank of *Contracaecum radiatum* (v. Linstow, 1907) [1995, eng] B-52631
Morphology and anatomy of *Avdeevia antarctica*, n.gen. n.sp., a cephalopod parasite [1994, eng] B-52099
New cestode species from antarctic batoid fish [1991, eng] B-53241
Occurrence dynamics of *Eubrachiella antarctica* (Quidor, 1906) on *Dissostichus eleginoides* from South Georgia [1993, eng] B-53089
Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] B-51767
Plasma protein concentration in *Notothenia neglecta* and *N. rossii* [1994, spa] B-52013
Preliminary survey for coccidian parasites in the birds at Cape Bird, Ross Island [1993, eng] B-52263
Two new species of eulimid gastropods endoparasitic in asteroids [1994, eng] B-52163
Winter population structure and feeding of chaetognaths and copepods in Gerlache Strait [1995, eng] B-52583

Particles
See under: Aurora

Particulates
Conversion kinetics in antarctic ice [1995, eng] F-52636
See [also]: Aerosols; Sediments

Pathology
Also used as subordinate term under various types of animals (plants)
HUMAN
Antibiotic resistance of intestinal bacteria from the indigenous fauna of McMurdo Sound, Antarctica [1993, eng] B-52249
Cell mediated immunity in antarctic wintering personnel; 1984-1992 [1995, eng] H-53624
Characteristics of acute high-altitude sickness in Antarctica [1992, rus] H-53592
Effect of the environment in Antarctica on immune function and electroencephalogram [1994, eng] H-52278
Haemophilus influenzae at a BAS station [1995, eng] H-52692
Immune responses during an antarctic summer [1995, eng] H-53990
Morbidity of wintering-over participants in Soviet antarctic expeditions of 1981-1985 [1992, rus] H-53593
Plasmid maintenance and expression in *Escherichia coli* exposed to the antarctic marine environment [1993, eng] B-52251
Report on the 30th Soviet Antarctic Expedition [1992, rus] A-53587
Seasonal variation of depressive symptoms in Antarctica [1995, eng] H-53991
Survey on changes of multiple humoral factors in antarctic expedition members [1994, eng] H-51723
Survival and recoverability of enteric bacteria exposed to the antarctic marine environment [1993, eng] B-52250

Patterned ground
Permafrost distribution in the southern circumpolar region [1995, eng] E-53707
Some observations regarding sorted stripes, Livingston Island, South Shetlands [1994, eng] E-51873

Pedology
Bacterial distribution in soils and plants of King George I. [1995, eng] B-52366
Characterization of humic acids isolated from antarctic soils [1995, eng] E-53528
Elemental and clay mineralogical composition of some soils on Penguin I. [1994, eng] E-52989
Environmental contamination on King George I. [1995, chi] B-53949
Heavy metal contamination in some soils of the McMurdo Sound region, Antarctica [1995, eng] E-52308
Hydrocarbons and sterols in marine sediments and soils at Davis Station [1995, eng] B-52835
McMurdo Dry Valleys: a cold desert ecosystem [1993, eng] B-52602
Metal biomonitoring with mosses for correcting soil contamination [1995, eng] B-53583
Microbes in the area of the South Shetland Islands [1994, eng] B-52273
Potential for bioremediation of fuel-contaminated soil in Antarctica [1995, eng] B-53725
Preliminary data on heavy metals in surface soil and macrolichens of northern Victoria Land [1994, eng] B-52559
Radionuclide deposition in the Antarctic Peninsula area [1994, eng] I-51977
Soil microbial community dynamics and enzyme activity in summer [1993, eng] B-53271
Survey of total number of bacteria and fungi isolated from the Fildes Peninsula in Antarctica [1994, chi] B-52288
Uranium in Schirmacher Hills soil [1995, eng] E-53216
Weathering stage as a relative age of till in the central Sør-Rondane [1994, eng] E-52029
CRYOPEDOLOGY
Bryophyte soil propagule banks at Jane Col [1993, eng] B-51780

BEHAVIOR
Antarctic fish gill under salinity stress [1995, eng] **B-53698**
Feeding and ecology of fish near Elephant I., winter 1986 [1994, eng] **B-53248**
Growth and metabolism in antarctic fish [1993, eng] **B-53275**
Ultrasonic instrument for under-sea ice observation of fishes [1995, jpn] **G-53700**

BLOOD AND CIRCULATION
α-globin genes in antarctic icefish [1995, eng] **B-52678**
Antifreeze glycopeptide in the silverfish *Pleuragramma antarcticum* [1995, eng] **B-53327**
Blood protein in an antarctic fish [1984, eng] **B-52818**
Blood proteins in an antarctic icefish [1994, eng] **B-52192**
Blood volume in the hemoglobinless antarctic teleost *Chionodraco hamatus* (Lönnberg) [1995, eng] **B-53621**
Effect of chronic heat stress on cortisol levels in the antarctic fish *Pagothenia borchgrevinki* [1995, eng] **B-53753**
Electrophoretic determination of plasma proteins in *Notothenia neglecta* and *N. rossii* [1994, spa] **B-52012**
Genomic basis for antifreeze peptide heterogeneity and abundance in eel pout [1995, eng] **B-53326**
Gut regulatory peptides in some antarctic notothenioids [1995, eng] **B-53415**
Haemoglobin thermostability in the hot-spring fish *Oreochromis alcalicus grahami* [1994, eng] **B-51720**
Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] **B-52555**
Molecular evolution at subzero temperatures: fish mitochondrial and nuclear phylogenies [1994, eng] **B-52475**
Morphofunctional design of the heart of the icefish *Chionodraco hamatus* (Lonnberg) [1994, eng] **B-52557**
Plasma protein concentration in *Notothenia neglecta* and *N. rossii* [1994, spa] **B-52013**
Structure and function of hemoglobins, enzymes and other proteins [1994, eng] **B-52554**
Structure of deoxyhaemoglobin of the antarctic fish *Pagothenia bernacchii* [1995, eng] **B-53359**

BREEDING CYCLES AND REPRODUCTION
Early lify history of the toothfish *Dissostichus eleginoides* around South Georgia [1995, eng] **B-53460**
Embryogenesis of *Notothenia neglecta* Nybelin in Admiralty Bay [1993, eng] **B-53088**
Icefish stock surveys in South Georgia, 1975-1992 [1993, eng] **B-53350**
Prolonged adolescent phase in Nototheniids [1994, eng] **B-52871**

ECOLOGY
Antarctic fish gill under salinity stress [1995, eng] **B-53698**
Biochemistry and freezing avoidance properties of the snailfish *Paraliparis devriesi* [1995, eng] **B-52237**
Environmental conditions and formation of icefish concentrations in the Cosmonaut Sea [1993, rus] **J-53771**
Feeding and ecology of fish near Elephant I., winter 1986 [1994, eng] **B-53248**
Growth of the antarctic fishes. A review [1994, eng] **B-52217**
Larval feeding ecology of 3 species of antarctic fishes from Gerlache Strait, Nov. 1989 [1993, eng] **B-52723**
Otolith annual growth in immature *Notothenia coriiceps* at Signy I. [1995, eng] **B-53951**

EMBRYOLOGY
Age estimation of fish larvae from otolith microstructure [1995, eng] **B-53933**
Early lify history of the toothfish *Dissostichus eleginoides* around South Georgia [1995, eng] **B-53460**
Embryogenesis of *Notothenia neglecta* Nybelin in Admiralty Bay [1993, eng] **B-53088**
Evidence for enkephalin-like antigenic determinants in the gonads of the icefish *Chionodraco hamatus* [1995, eng] **B-52367**
Larval feeding ecology of 3 species of antarctic fishes from Gerlache Strait, Nov. 1989 [1993, eng] **B-52723**
Larval fish distribution and abundance in the Antarctic Peninsula region and adjacent waters [1995, eng] **B-52369**

EVOLUTION
Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] **B-52555**
Molecular evolution at subzero temperatures: fish mitochondrial and nuclear phylogenies [1994, eng] **B-52475**
Polymerization of antarctic fish tubulins [1994, eng] **B-53212**
Skeletal development in the nototheniids [1995, eng] **B-52527**
Structual diversity in the lateral line system of antarctic fish: adaptive or non-adaptive? [1995, eng] **B-53451**

EXPLOITATION
Antarctic juvenile fish taken in krill fisheries around South Georgia in 1992 [1994, eng] **A-51999**
Antarctic resources: a dichotomy of interest [1991, eng] **A-52874**
Capture of the giant nototheniid *Dissostichus mawsoni* in Terra Nova Bay [1994, eng] **B-51718**
Effects of trawl fishing on icefish populations [1993, rus] **A-53795**
Estimating confidence intervals for fish stock abundance estimates from trawl surveys [1994, eng] **A-52005**
Fish offal as albatross food [1995, eng] **B-52575**
Growth of the antarctic fishes. A review [1994, eng] **B-52217**
Icefish stock surveys in South Georgia, 1975-1992 [1993, eng] **B-53350**
Necton and antarctic fishing resources, 1987-1988 [1990, eng] **B-53897**
Presence of two crab species in catches in the Scotia Sea [1994, eng] **B-52002**
Report of the SC-CAMLR 13th meeting, 1994 [1994, eng] **B-53099**
Science in support of southern ocean fisheries management [1995, eng] **A-52660**
Seabird interactions with fisheries at the South Sandwich Islands and South Georgia [1994, eng] **B-52000**

GEOGRAPHIC DISTRIBUTION
Antarctic juvenile fish taken in krill fisheries around South Georgia in 1992 [1994, eng] **A-51999**
Eelpouts of antarctic and subantarctic regions [1994, eng] **B-53518**
Environmental conditions and formation of icefish concentrations in the Cosmonaut Sea [1993, rus] **J-53771**
Fish fauna in Gerlache Strait, Oct.-Nov. 1989 [1993, eng] **B-52722**
Larval fish distribution and abundance in the Antarctic Peninsula region and adjacent waters [1995, eng] **B-52369**
New species of liparidid fishes of the genus *Careproctus* [1992, eng] **B-53609**
Oceanic conditions for antarctic fish abundance [1993, rus] **J-53772**
Plasma protein concentration in *Notothenia neglecta* and *N. rossii* [1994, spa] **B-52013**
Post-hatching diet of Adélie penguins in Hope Bay, 1987-1988 [1995, eng] **B-53412**

MIGRATION
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] **B-53891**

MORPHOLOGY
α-globin genes in antarctic icefish [1995, eng] **B-52678**
Acanthodraco dewitti n.sp. (Pisces, Bathydraconidae) from Admiralty Bay [1995, eng] **B-53817**
Aerobic energy metabolism in antarctic fish [1995, eng] **B-52825**
Age estimation of fish larvae from otolith microstructure [1995, eng] **B-53933**
Antarctic fish gill under salinity stress [1995, eng] **B-53698**
Brain morphology in antarctic notothenioids [1995, eng] **B-52413**
Capture of the giant nototheniid *Dissostichus mawsoni* in Terra Nova Bay [1994, eng] **B-51718**
Cytogenetics and morphofunctional adaptations in Notothenioid fishes [1994, eng] **B-52549**
Diet of the mackerel icefish at South Georgia [1994, eng] **B-52880**
Early lify history of the toothfish *Dissostichus eleginoides* around South Georgia [1995, eng] **B-53460**
Eelpouts of antarctic and subantarctic regions [1994, eng] **B-53518**
Evidence for enkephalin-like antigenic determinants in the gonads of the icefish *Chionodraco hamatus* [1995, eng] **B-52367**
Form and function in antarctic notothenioid fish [1994, eng] **B-52418**
Gut regulatory peptides in some antarctic notothenioids [1995, eng] **B-53415**
Liparid fish from the subantarctic Indian Ocean [1995, eng] **B-52525**
Morphofunctional design of the heart of the icefish *Chionodraco hamatus* (Lonnberg) [1994, eng] **B-52557**
Neuromasts in antarctic nototheniids [1994, eng] **B-52414**
New species of liparidid fishes of the genus *Careproctus* [1992, eng] **B-53609**
Notothenioid periventricular morphology [1995, eng] **B-53739**
Occurrence dynamics of *Eubrachiella antarctica* (Quidor, 1906) on *Dissostichus eleginoides* from South Georgia [1993, eng] **B-53089**
Oplegnathid fish from the Eocene of Antarctica [1995, eng] **E-52788**
Osteological development of the antarctic silverfish *Pleuragramma antarcticum* (Nototheniidae) [1994, eng] **B-51717**
Otolith annual growth in immature *Notothenia coriiceps* at Signy I. [1995, eng] **B-53951**
Polymerization of antarctic fish tubulins [1994, eng] **B-53212**
Reevaluation of a Late Eocene fossil teleost [1995, eng] **E-52526**

Skeletal development in the nototheniids [1995, eng] B-52527
Structual diversity in the lateral line system of antarctic fish: adaptive or non-adaptive? [1995, eng] B-53451
Taxonomy of *L. squamiformes* in the antarctic environs [1919, eng] B-53942
NUTRITION
Antarctic juvenile fish taken in krill fisheries around South Georgia in 1992 [1994, eng] A-51999
Diet of seven species of antarctic fishes and estimation of their daily rations [1992, eng] B-53610
Diet of the mackerel icefish at South Georgia [1994, eng] B-52880
Diet of *Trematomus newnesi* Boulenger, 1902, from Terra Nova Bay [1995, eng] B-52312
Feeding and ecology of fish near Elephant I., winter 1986 [1994, eng] B-53248
Larval feeding ecology of 3 species of antarctic fishes from Gerlache Strait, Nov. 1989 [1993, eng] B-52723
PATHOLOGY
Additional new cestodes from antarctic batoids [1991, eng] B-53242
Antarctic fish gill under salinity stress [1995, eng] B-53698
Aromatic hydrocarbon exposure in fish near Palmer and McMurdo stations [1995, eng] B-53581
Chlorinated hydrocarbons, trace elements and mixed function oxidases (MFO) activity in antarctic organisms [1994, eng] B-52558
Contamination evaluation in fish, seabirds and Weddell seals from Terra Nova Bay [1995, eng] B-52311
Induction of MFO activity in the antarctic fish *Pagothenia bernacchii*: preliminary results [1995, eng] B-52779
Isozyme variation and taxonomic rank of *Contracaecum radiatum* (v. Linstow, 1907) [1995, eng] B-52631
New cestode species from antarctic batoid fish [1991, eng] B-53241
Occurrence dynamics of *Eubrachiella antarctica* (Quidor, 1906) on *Dissostichus eleginoides* from South Georgia [1993, eng] B-53089
Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] B-51767
Oxygen uptake in teleost *Pagothenia borchgrevinki* and X-cell gill disease [1990, eng] B-53819
PCB ocean pollution at Saint Paul and Amsterdam Is. [1995, eng] J-53517
Plasma protein concentration in *Notothenia neglecta* and *N. rossii* [1994, spa] B-52013
Polycyclic aromatic hydrocarbon metabolites obtained from fish injected with Diesel Fuel Arctic [1995, eng] B-53582
PHYSIOLOGY
α-globin genes in antarctic icefish [1995, eng] B-52678
Aerobic energy metabolism in antarctic fish [1995, eng] B-52825
Age estimation of fish larvae from otolith microstructure [1995, eng] B-53933
Antarctic juvenile fish taken in krill fisheries around South Georgia in 1992 [1994, eng] A-51999
Antifreeze glycopeptide in the silverfish *Pleuragramma antarcticum* [1995, eng] B-53327
Aromatic hydrocarbon exposure in fish near Palmer and McMurdo stations [1995, eng] B-53581
Biochemistry and freezing avoidance properties of the snailfish *Paraliparis devriesi* [1995, eng] B-52237
Blood protein in an antarctic fish [1984, eng] B-52818
Blood proteins in an antarctic icefish [1994, eng] B-52192
Chlorinated hydrocarbons, trace elements and mixed function oxidases (MFO) activity in antarctic organisms [1994, eng] B-52558
Comparison of lipid composition of intenstinal cell membranes between antarctic and temperate fish [1994, eng] B-52556
Cytogenetics and morphofunctional adaptations in Notothenioid fishes [1994, eng] B-52549
Early lify history of the toothfish *Dissostichus eleginoides* around South Georgia [1995, eng] B-53460
Effect of chronic heat stress on cortisol levels in the antarctic fish *Pagothenia borchgrevinki* [1995, eng] B-53753
Electrophoretic patterns of sarcoplasmatic proteins of some antarctic fish [1990, eng] B-53898
Evidence for enkephalin-like antigenic determinants in the gonads of the icefish *Chionodraco hamatus* [1995, eng] B-52367
Form and function in antarctic notothenioid fish [1994, eng] B-52418
Genomic basis for antifreeze peptide heterogeneity and abundance in eel pout [1995, eng] B-53326
Growth and metabolism in antarctic fish [1993, eng] B-53275
Growth of the antarctic fishes. A review [1994, eng] B-52217
Gut regulatory peptides in some antarctic notothenioids [1995, eng] B-53415
Haemoglobin thermostability in the hot-spring fish *Oreochromis alcalicus grahami* [1994, eng] B-51720
Heavy metals and antioxidant enzymes in antarctic Protozoa and fish [1994, eng] B-52562
Induction of MFO activity in the antarctic fish *Pagothenia bernacchii*: preliminary results [1995, eng] B-52779
Interpopulation relationships in two species of antarctic fish [1995, eng] B-53952
Low temperature increases gain in the fish oculomotor system [1984, eng] B-52819
Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] B-52555
Molecular evolution at subzero temperatures: fish mitochondrial and nuclear phylogenies [1994, eng] B-52475
Mono- and polyunsaturated sedimentary hydrocarbons in the lipids of marine organisms [1995, eng] B-52782
Morphofunctional design of the heart of the icefish *Chionodraco hamatus* (Lonnberg) [1994, eng] B-52557
Neuromasts in antarctic nototheniids [1994, eng] B-52414
Notothenioid periventricular morphology [1995, eng] B-53739
Novel neural beta tubulin from the antarctic fish *Notothenia coriiceps neglecta* [1993, eng] B-52261
Otolith annual growth in immature *Notothenia coriiceps* at Signy I. [1995, eng] B-53951
Oxygen uptake in teleost *Pagothenia borchgrevinki* and X-cell gill disease [1990, eng] B-53819
Plasma protein concentration in *Notothenia neglecta* and *N. rossii* [1994, spa] B-52013
Polycyclic aromatic hydrocarbon metabolites obtained from fish injected with Diesel Fuel Arctic [1995, eng] B-53582
Polymerization of antarctic fish tubulins [1994, eng] B-53212
Prolonged adolescent phase in Nototheniids [1994, eng] B-52871
Structual diversity in the lateral line system of antarctic fish: adaptive or non-adaptive? [1995, eng] B-53451
Structure and function of hemoglobins, enzymes and other proteins [1994, eng] B-52554
Structure of deoxyhaemoglobin of the antarctic fish *Pagothenia bernacchii* [1995, eng] B-53359
POPULATION
Acoustic, trawl and trapping surveys of the epipelagic communities in the Weddell Sea [1993, eng] B-52259
Effects of trawl fishing on icefish populations [1993, rus] A-53795
Embryogenesis of *Notothenia neglecta* Nybelin in Admiralty Bay [1993, eng] B-53088
Environmental conditions and formation of icefish concentrations in the Cosmonaut Sea [1993, rus] J-53771
Estimating confidence intervals for fish stock abundance estimates from trawl surveys [1994, eng] A-52005
Fish fauna in Gerlache Strait, Oct.-Nov. 1989 [1993, eng] B-52722
Growth of the antarctic fishes. A review [1994, eng] B-52217
Icefish stock surveys in South Georgia, 1975-1992 [1993, eng] B-53350
Larval fish distribution and abundance in the Antarctic Peninsula region and adjacent waters [1995, eng] B-52369
Oceanic conditions for antarctic fish abundance [1993, rus] J-53772
Prolonged adolescent phase in Nototheniids [1994, eng] B-52871
Weddell Sea: a high polar ecosystem [1992, eng] B-53967
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] B-53891
TAXONOMY
Acanthodraco dewitti n.sp. (Pisces, Bathydraconidae) from Admiralty Bay [1995, eng] B-53817
Eelpouts of antarctic and subantarctic regions [1994, eng] B-53518
Electrophoretic patterns of sarcoplasmatic proteins of some antarctic fish [1990, eng] B-53898
Fish fauna in Gerlache Strait, Oct.-Nov. 1989 [1993, eng] B-52722
Interpopulation relationships in two species of antarctic fish [1995, eng] B-53952
Liparid fish from the subantarctic Indian Ocean [1995, eng] B-52525
Molecular evolution at subzero temperatures: fish mitochondrial and nuclear phylogenies [1994, eng] B-52475
New species of liparidid fishes of the genus *Careproctus* [1992, eng] B-53609
Reevaluation of a Late Eocene fossil teleost [1995, eng] E-52526
Taxonomy of *L. squamiformes* in the antarctic environs [1919, eng] B-53942

Place names

Plankton
Antarctic marine top predators revisited: homeotherms do not leak much CO_2 to the air [1995, eng] B-52364
Bacterioplankton biomass and production in the Antarctic [1993, rus] B-53804
Biogenic hydrocarbons in particulate material of the Bellingshausen Sea marginal ice zone [1995, eng] J-53851
Biology of the southern ocean [1994, eng] B-52573
Diurnal vertical migration of antarctic macroplankton [1994, eng] B-52125

Effects of organic materials on the growth of subantarctic marine bacteria [1994, eng] **B-52588**
Feeding of dominant species of antarctic zooplankton in summer [1993, rus] **B-53805**
Geochemistry of Lützow-Holm Bay sediments [1992, eng] **E-52750**
Humic substances in the nitrogen cycle of polar waters [1994, eng] **J-52172**
Importance of iron for plankton in the southern ocean [1995, eng] **B-52289**
Italian expedition in the Ross Sea, 1987-1988, Part II [1990, eng] **B-53900**
Long-term dynamics of phytoplankton biomass in the Commonwealth Sea during summers 1977-1988 [1993, rus] **B-53776**
Marine microflora in Terra Nova Bay [1990, eng] **B-53887**
Microzooplankton's role in controlling phytoplankton growth [1995, eng] **B-53858**
Nitrogen dynamics in the Bellingshausen Sea during the Austral spring of 1992 [1995, eng] **J-53857**
Particulate composition and bacterial distribution in Terra Nova Bay, summer 1989-1990 [1995, eng] **B-53410**
Pelagic ecosystems of the southern ocean: collected scientific papers [1993, rus] **J-53759**
Photoautotrophic picoplankton of Terra Nova Bay and some northern Victoria Land lakes [1994, eng] **B-52545**
Planktonic communities of melt ponds on the McMurdo Ice Shelf, Antarctica [1995, eng] **B-53930**
Polarstern "ANT X/3" austral autumn in the ice 1992: sea-ice community studies [1993, eng] **B-52253**
Primary production and picoplankton C assimilation in the Ross Sea (Antarctica) [1990, eng] **B-53888**
Primary production in the southern ocean [1991, eng] **B-53876**
Seasonal reconstruction of the antarctic plankton community [1993, rus] **B-53798**
Size-fractionated primary production in the open southern ocean in austral spring [1995, eng] **B-53409**
Spring plankton community respiration in Bransfield Strait [1995, eng] **J-53989**
Summer biogenic silica and organic particulate matter distribution around the South Shetland Is. [1995, eng] **J-52365**
Terra Nova Bay benthos studies [1990, eng] **B-53893**
Upwelling-generated plankton strandlines as food source for seabirds at South Georgia [1995, eng] **B-53598**
Use of PCR for detection of ammonium-oxidizing bacteria in water samples [1995, eng] **B-53836**
Zooplankton acoustic backscatter and distribution [1995, eng] **J-53844**

PHYTOPLANKTON
^{13}C and ^{15}N uptake by phytoplankton in the marginal ice zone of the Bellingshausen Sea [1995, eng] **J-53856**
Adaptation of the benthic microbial community in an inshore coastal sediment at Signy I. [1993, eng] **B-53273**
AMLR program: Rates of primary production around Elephant Island, Antarctica [1993, eng] **B-52728**
Antarctic krill and the structure of plankton community in its areal [1991, rus] **B-53418**
Antarctic ozone hole, UV radiation and phytoplankton [1995, ger] **I-52865**
Antarctic planktonic biomass seasonal variations [1995, eng] **B-53867**

GEOGRAPHIC DISTRIBUTION
Salp and krill distribution near the South Shetlands during summer 1990-1991 [1995, eng] **B-52334**
NUTRITION
Feeding of dominant species of antarctic zooplankton in summer [1993, rus] **B-53805**
PHYSIOLOGY
Mono- and polyunsaturated sedimentary hydrocarbons in the lipids of marine organisms [1995, eng] **B-52782**
POPULATION
AMLR program: Krill and macrozooplankton in the Elephant Island area, January to March 1993 [1993, eng] **B-52726**
Salp and krill distribution near the South Shetlands during summer 1990-1991 [1995, eng] **B-52334**
Status of the krill stock around Elephant Island in 1991/92 and 1992/93 [1994, eng] **B-51992**
Protozoa
Benthic foraminifers of the Antarctic Peninsula [1994, eng] **J-52412**
Derived constituents in the glacial sediments of the Vestfold Hills [1994, eng] **E-52098**
Eocene dinoflagellates form CIROS-1 drill hole, McMurdo Sound, Antarctica [1994, eng] **E-51930**
Glacial antarctic intermediate water [1994, eng] **J-52747**
Polarstern "ANT X/3" austral autumn in the ice 1992: sea-ice community studies [1993, eng] **B-52253**
ECOLOGY
Aquatic testate amoebae fauna of the Strømness Bay area, South Georgia [1995, eng] **B-52307**
Living foraminifera in Terra Nova Bay [1990, eng] **B-53895**
Morphology and morphogenesis of two new species of protozoa from antarctic sea ice [1995, eng] **B-53447**
Origins and biogeography of Cretaceous/Tertiary biserial planktonic foraminifera [1993, eng] **E-52244**
Populations of a unique autotrophic ciliate in brackish and saline lakes of the Vestfold Hills [1995, eng] **B-53414**
Quantitative analysis of antarctic benthic foraminifera [1990, eng] **B-53716**
Temperature relations of soil protists as an indicator of climatic change [1995, eng] **B-53325**

Thermophilic isolates from Antarctica [1994, eng] B-52553
GEOGRAPHIC DISTRIBUTION
Aquatic testate amoebae fauna of the Strømness Bay area, South Georgia [1995, eng] B-52307
Distribution of living benthic foraminifera in Terra Nova Bay [1990, eng] B-53906
Planktonic infusorians in the Atlantic sector of the southern ocean [1993, rus] B-53781
Quantitative analysis of antarctic benthic foraminifera [1990, eng] B-53716
Reconstructed paleoenvironment of the South Atlantic Ocean [1995, ger] J-53536
MORPHOLOGY
Description of three endocommensal ciliates from sea urchins in the Weddell Sea [1994, chi] B-51751
Distribution of living benthic foraminifera in Terra Nova Bay [1990, eng] B-53906
Effects of cadmium on *Uronema marinum* (Ciliophora Scuticociliatida) [1994, eng] B-52473
Heavy metals and antioxidant enzymes in antarctic Protozoa and fish [1994, eng] B-52562
Morphology and morphogenesis of two new species of protozoa from antarctic sea ice [1995, eng] B-53447
Speciation and adaptive biology of antarctic ciliated protozoa [1994, eng] B-52550
Thermophilic isolates from Antarctica [1994, eng] B-52553
Three new species of *Thaumatomastix* genus from the antarctic ice biota [1995, eng] B-53448
Upper Cretaceous calcareous nannoplankton from the *Pecten* Conglomerate on Cockburn I. [1994, eng] E-52669
NUTRITION
Microzooplankton's role in controlling phytoplankton growth [1995, eng] B-53858
PATHOLOGY
Effects of cadmium on *Uronema marinum* (Ciliophora Scuticociliatida) [1994, eng] B-52473
Three new species of *Thaumatomastix* genus from the antarctic ice biota [1995, eng] B-53448
PHYSIOLOGY
Effects of cadmium on *Uronema marinum* (Ciliophora Scuticociliatida) [1994, eng] B-52473
Heavy metals and antioxidant enzymes in antarctic Protozoa and fish [1994, eng] B-52562
Phytoplankton composition and cell carbon distribution in Prydz Bay [1995, eng] B-52797
Speciation and adaptive biology of antarctic ciliated protozoa [1994, eng] B-52550
Temperature relations of soil protists as an indicator of climatic change [1995, eng] B-53325
Thermophilic isolates from Antarctica [1994, eng] B-52553
Three new species of *Thaumatomastix* genus from the antarctic ice biota [1995, eng] B-53448
POPULATION
Isotope composition of marine foraminifers [1994, eng] B-52180
Living foraminifera in Terra Nova Bay [1990, eng] B-53895
Microzooplankton's role in controlling phytoplankton growth [1995, eng] B-53858
Planktonic communities of melt ponds on the McMurdo Ice Shelf, Antarctica [1995, eng] B-53930
Planktonic infusorians in the Atlantic sector of the southern ocean [1993, rus] B-53781
Populations of a unique autotrophic ciliate in brackish and saline lakes of the Vestfold Hills [1995, eng] B-53414
Quantitative analysis of antarctic benthic foraminifera [1990, eng] B-53716
TAXONOMY
Aquatic testate amoebae fauna of the Strømness Bay area, South Georgia [1995, eng] B-52307
Cretaceous-Tertiary boundary transition, antarctic ocean [1994, eng] E-52410
Distribution of living benthic foraminifera in Terra Nova Bay [1990, eng] B-53906
Foraminifera from the surface sediments in the Great Wall Bay [1994, chi] B-53167
Living foraminifera in Terra Nova Bay [1990, eng] B-53895
Morphology and morphogenesis of two new species of protozoa from antarctic sea ice [1995, eng] B-53447
Reconstructed paleoenvironment of the South Atlantic Ocean [1995, ger] J-53536
Reply to comment on "Cretaceous-Tertiary boundary transition" [1994, eng] E-52411
Speciation and adaptive biology of antarctic ciliated protozoa [1994, eng] B-52550
Three new species of *Thaumatomastix* genus from the antarctic ice biota [1995, eng] B-53448

Weddell Sea ice conditions from multi-sensor observations [1994, eng] F-51842
FORECASTING
Demonstration project to supply near real time sea ice information [1994, eng] F-54023
Research on Antarctic sea ice [1992, rus] F-53123
Sea-ice velocity fields estimation on Ross Sea with NOAA-AVHRR [1995, eng] F-53833
FORMATION
Antarctic sea ice cover [1994, eng] F-51688
Controls on antarctic sea ice biological communities [1994, eng] J-51832
Effect of sea ice on the salinity of antarctic bottom waters [1995, eng] J-53626
Effects of the snow cover on antarctic sea ice [1995, eng] F-53502
In situ experimental study of young sea ice formation on an antarctic lead [1995, eng] F-52465
Life forms in antarctic sea ice [1995, eng] J-53046
Life forms in antarctic sea ice [1992, ger] F-53695
Marine ice formation in a floating ice tongue [1995, eng] F-52706
Melting and freezing rates beneath Filchner-Ronne Ice Shelf from a 3D-ocean circulation model [1994, eng] J-52294
Method to estimate subpixel-scale coastal polynyas with satellite passive microwave data [1995, eng] F-52464
Oxygen isotope study of water masses in the Princess Elizabeth Trough, Antarctica [1995, eng] J-53137
Remote sensing of antarctic coastal polynya dynamics [1994, eng] F-51841
Remote sensing of snow and ice and its relevance to climate change processes [1994, eng] F-52049
Sea ice formation and bottom water outflow in the Weddell Sea [1995, eng] F-53478
Study on the oscillation relationship between sea ice of the Arctic and Antarctic [1994, eng] F-52762
HEAT EXCHANGE
Antarctic sea ice cover [1994, eng] F-51688
Impact of greenhouse effect on polar cryosphere [1995, eng] I-52459
Influence of the albedo-temperature feed-back on climate sensitivity [1995, eng] F-53501
Interaction between antarctic sea ice and ENSO events [1994, eng] F-52761
Micrometeorological observation over the fast ice at Ongul Strait near Syowa Station [1994, eng] I-52760
Model *vs* observations in Weddell Sea ice [1995, ger] F-52870
On the surface heat fluxes in the Weddell Sea [1994, eng] J-51881
Outgoing longwave radiation, surface temperature and sea ice [1993, eng] I-52184
Radiative effects of clouds, ice sheet and sea ice in the Antarctic [1994, eng] I-52187
Sea ice formation and bottom water outflow in the Weddell Sea [1995, eng] F-53478
Simulations of the 1979-88 polar climates by global climate models [1995, eng] I-53486
MASS BALANCE
Detection of change in Antarctica [1994, eng] A-51693
MECHANICAL PROPERTIES
Internal stresses at typical local inhomogeneities of sea ice cover [1995, eng] F-53393
Sensitive and robust strain-meter for ice studies [1994, eng] G-52603
Structure of internal stresses in the uncompacted ice cover [1995, eng] F-53604
MORPHOLOGY
Comparison of radar backscatter from antarctic and arctic sea ice [1995, eng] F-52614
PHYSICAL PROPERTIES
Antarctic journal of the United States, vol.29, no.1 [1994, eng] A-53566
Compressive strength and structure of sea ice in the Weddell Sea, Antarctica [1994, eng] F-52048
Glacial-ice fragments in antarctic sea ice [1995, eng] F-53643
In situ experimental study of young sea ice formation on an antarctic lead [1995, eng] F-52465
Model *vs* observations in Weddell Sea ice [1995, ger] F-52870
POLLUTION
340 year record of biogenic sulphur from the Weddell Sea area, Antarctica [1995, eng] F-53495
RADIATION
Bio-optical model of sea-ice algal growth [1994, eng] B-51703
Intercomparisons of sea ice concentration from SSM/I and AVHRR data of the Ross Sea [1995, eng] F-53810
Satellite remote sensing of polar snow and ice: present status and future directions [1995, eng] F-52973
SOUNDINGS
Comparison of radar backscatter from antarctic and arctic sea ice [1995, eng] F-52614
STRUCTURE
Compressive strength and structure of sea ice in the Weddell Sea, Antarctica [1994, eng] F-52048
Glacial-ice fragments in antarctic sea ice [1995, eng] F-53643
Life forms in antarctic sea ice [1995, eng] J-53046
Physical parameters influencing diatom community structure in eastern antarctic sea ice [1994, eng] B-51766
Weddell Sea air-ice drag coefficients, pt.1 [1995, eng] F-52467
SURFACE FEATURES
Antarctic sea ice passive microwave signatures during summer and autumn [1994, eng] F-51840
Exploration of C-band σ° dependence on azimuth angle over antarctic sea and glacial ice [1995, eng] F-53481
Laser profiling of the ice surface topography during the Winter Weddell Gyre Study 1992 [1995, eng] F-52466
Modelling the extent of sea ice ridging in the Weddell Sea [1994, eng] F-51877
Sea ice thickness changes and their relation to climate [1994, eng] F-51879
Some active and passive microwave signatures of antarctic sea ice from mid-winter to spring 1991 [1995, eng] F-53596
Spatial resolution improvement of SSM/I data with image restoration techniques [1994, eng] F-51819
Weddell Sea air-ice drag coefficients, pt.1 [1995, eng] F-52467
Weddell Sea air-ice drag coefficients, pt.2 [1995, eng] F-52468
TEMPERATURE
Algorithm development and application for ice surface temperature retrieval from satellite data [1994, eng] F-53084
Compressive strength and structure of sea ice in the Weddell Sea, Antarctica [1994, eng] F-52048
Internal stresses at typical local inhomogeneities of sea ice cover [1995, eng] F-53393
Sea ice concentrations derived from SMMR and SSMI [1994, eng] F-54022
TERMINOLOGY
Antarctic snow and ice sciences glossary [1982, jpn] F-53631
THAWING
Inorganic nutrients in the marginal ice zone of the Bellingshausen Sea in spring [1995, eng] J-53846
Modelling the ice-ocean-plankton interactions in the southern ocean [1994, eng] J-51983
Warm Weddell Deep Water west of Maud Rise [1995, eng] J-53433
THICKNESS
Atmospheric forcing of sea ice models [1994, eng] F-51880
Competing roles of heat and freshwater flux in forcing thermohaline oscillations [1995, eng] J-53627
Internal stresses at typical local inhomogeneities of sea ice cover [1995, eng] F-53393
Laser profiling of the ice surface topography during the Winter Weddell Gyre Study 1992 [1995, eng] F-52466
Life forms in antarctic sea ice [1992, ger] F-53695
Modeling the formation and deposition of frazil ice beneath Filchner-Ronne Ice Shelf [1995, eng] F-52705
Modelling the extent of sea ice ridging in the Weddell Sea [1994, eng] F-51877
NCAR CCM2 simulation of the modern antarctic climate [1994, eng] I-51837
Research on Antarctic sea ice [1992, rus] F-53123
Sea ice core data obtained in Lützow-Holm Bay during JARE-31 and 32, 1990-1992 [1995, eng] F-52798
Sea ice role in climate sensitivity, pt.1 [1995, eng] F-52831
Sea ice thickness changes and their relation to climate [1994, eng] F-51879
Sea-ice dynamics and CO_2 sensitivity in a global climate model [1994, eng] I-51705
Seasonal changes of sea-ice characteristics off East Antarctica [1994, eng] F-52919
Step frequency radar experiments on the antarctic sea ice [1988, eng] F-52038
Variability of physical and structural characteristics of antarctic fast ice [1994, eng] F-52899
VARIATIONS
Antarctic sea ice passive microwave signatures during summer and autumn [1994, eng] F-51840
Bio-optical model of sea-ice algal growth [1994, eng] B-51703
Climate change detection from satellite sensing of polar sea ice [1995, eng] F-53480
Effect of antarctic sea ice on atmospheric circulation [1995, eng] F-52832

Ice motion analysis on different spatial scales in the Weddell Sea [1995, eng] F-53482
Impact of greenhouse effect on polar cryosphere [1995, eng] I-52459
Internal stresses at typical local inhomogeneities of sea ice cover [1995, eng] F-53393
Laser profiling of the ice surface topography during the Winter Weddell Gyre Study 1992 [1995, eng] F-52466
Modulation of hemispheric sea-ice cover by ENSO events [1995, eng] F-52178
Polar news/Notizie polari, Vol.10, No.6 [1995, ita] A-53527
Proceedings [1995, eng] F-53485
RADARSAT and operational ice information [1994, eng] C-52425
Recent sea-ice advances in Baffin Bay/Davis Strait and retreats in the Bellingshausen Sea [1995, eng] F-53500
Remote sensing of snow and ice and its relevance to climate change processes [1994, eng] F-52049
Remote sensing of southern ocean sea ice geophysics [1994, eng] F-51845
Remote sensing of Weddell Sea ice drift [1994, eng] F-51843
Sea ice concentrations derived from SMMR and SSMI [1994, eng] F-54022
Sea ice formation and bottom water outflow in the Weddell Sea [1995, eng] F-53478
Sea ice role in climate sensitivity, pt.1 [1995, eng] F-52831
Sea ice variation at the South Orkney Is. [1995, eng] F-53822
Seasonal changes of sea-ice characteristics off East Antarctica [1994, eng] F-52919
Simulation of the mesocyclonic activity in the Ross Sea, Antarctica [1995, eng] I-53373
Southern ocean sea ice distribution [1994, eng] F-52695
Study on the oscillation relationship between sea ice of the Arctic and Antarctic [1994, chi] F-51750
Study on the oscillation relationship between sea ice of the Arctic and Antarctic [1994, eng] F-52762
Weddell Sea air-ice drag coefficients, pt.2 [1995, eng] F-52468
Weddell Sea ice conditions from multi-sensor observations [1994, eng] F-51842

VOLUME
Effects of the snow cover on antarctic sea ice [1995, eng] F-53502
Laser profiling of the ice surface topography during the Winter Weddell Gyre Study 1992 [1995, eng] F-52466
Quaternary geology at Lions Rump, King George I. [1994, eng] E-52961
Recent sea-ice advances in Baffin Bay/Davis Strait and retreats in the Bellingshausen Sea [1995, eng] F-53500
Snow and ice characteristics of the Bellingshausen Sea, during the spring melt [1995, eng] F-53845

Sea level
Assimilation of satellite altimeter data into an open ocean model [1995, eng] J-53658
Fine resolution antarctic model (FRAM) ocean current simulations [1995, eng] J-52469
Geomorphology and neotectonics of Hurd Peninsula [1995, eng] E-53957
Global effects of greenhouse gas concentration constraint [1995, eng] I-52131
Holocene environmental changes along the coast of Victoria Land [1994, eng] E-52076
Holocene raised beaches in the Lützow-Holm Bay region, East Antarctica [1994, eng] E-52075
Ice sheets and sea level [1995, eng] F-51964
Isotopic analysis of Ross Sea ice sheet deposits, McMurdo Sound [1995, eng] E-52972
Late Neogene record of paleoenvironmental change from the southern ocean: regional and global implications [1994, eng] E-51960
Mantle flow over the Australian-Antarctic Discordance [1995, eng] J-52684
Modelling the antarctic ice-sheet changes through time [1994, eng] F-52934
Progress towards a Cenozoic antarctic glacial history [1994, eng] E-51887
RACER: The tides at Palmer Station [1993, eng] J-52716
Reef drowning due to sea-level rise during the last deglaciation [1995, eng] J-52228
Satellite altimetry and FRAM model of the southern ocean [1994, eng] J-54021
Sea ice role in climate sensitivity, pt.1 [1995, eng] F-52831
Sea level and stratigraphy in the Neptune Range [1995, eng] E-52691
Sea-level rise: a review of recent past and near-future trends [1995, eng] J-52977
Sedimentation by the antarctic ice sheet from a glaciological perspective [1994, eng] F-51888
Seismic stratigraphic analysis of Miocene to Pleistocene strata in eastern Ross Sea [1994, eng] E-51934
West antarctic ice sheet collapse: chimera or clear danger? [1993, eng] F-51789

Sea transportation

ACOUSTICS
Acoustic, trawl and trapping surveys of the epipelagic communities in the Weddell Sea [1993, eng] B-52259
Antarctic exploration using a non-constant diameter solid towed hydrophone array [1994, eng] J-52185
Biological acoustic survey in the marginal ice-edge zone of the Bellingshausen Sea [1995, eng] B-53853
Biomass estimates of *Euphausia superba* [1995, eng] B-53306
Krill acoustic studies and results from the Antarctic Peninsula grid [1993, eng] B-52736
Marine mammals exposed to transmissions from the Heard I. Feasibility Test [1994, eng] B-52124
Palmer LTER: Krill distribution and biomass within coastal waters near Palmer Station [1993, eng] B-52737
Propulsion jet of krill as a potential communication signal [1995, eng] B-52995
Studies on antarctic euphausiids [1993, eng] B-52997
Subantarctic water mass effects on ocean sound transmission [1994, eng] J-52696
Ultrasonic instrument for under-sea ice observation of fishes [1995, jpn] G-53700
Zooplankton acoustic backscatter and distribution [1995, eng] J-53844

CHEMISTRY
^{13}C and ^{15}N uptake by phytoplankton in the marginal ice zone of the Bellingshausen Sea [1995, eng] J-53856
^{228}Ra and ^{228}Th in the Weddell Sea [1994, eng] J-51876
Air-sea CO_2 fluxes in the Southern Ocean between 25E and 85E [1994, eng] J-51878
AMLR program: Rates of primary production around Elephant Island, Antarctica [1993, eng] B-52728
Annual cycle variations of coastal primary productivity and chlorophyll in Admiralty Bay [1993, rus] B-53803
Antarctic bottom water formation and the global cadmium to phosphorus relationship [1995, eng] J-53719
Antarctic crustacean metabolism as a depth/seasonal function [1994, eng] B-51659
Antarctic marine top predators revisited: homeotherms do not leak much CO_2 to the air [1995, eng] B-52364
Antarctic ocean Pleistocene biomass variations from bottom sediments [1995, eng] J-52480
Antarctic planktonic biomass seasonal variations [1995, eng] B-53867
Antarctic zoobenthos [1994, eng] B-52794
ANTARKTIS XII expedition report, Leg 2 [1995, ger] D-54033
Aromatic hydrocarbon exposure in fish near Palmer and McMurdo stations [1995, eng] B-53581
Bacteria in sea ice and underlying water of the eastern Weddell Sea in midwinter [1995, eng] B-52453
Bacterial exoprotease activity in the Antarctic Peninsula region, autumn 1993 [1993, eng] B-52740
Beam attenuation and chlorophyll concentration and reflectance [1995, eng] J-53843
Biogenic hydrocarbons in particulate material of the Bellingshausen Sea marginal ice zone [1995, eng] J-53851
Biogenic production of dimethyl sulfide: krill grazing [1993, eng] B-52260
Biogeochemical model for seawater [1995, eng] J-53276
Biogeochemical study in the Bellingshausen Sea: overview of the STERNA 1992 expedition [1995, eng] J-53840
Biological acoustic survey in the marginal ice-edge zone of the Bellingshausen Sea [1995, eng] B-53853
Biological and chemical studies in Terra Nova Bay [1991, eng] J-53872
Carbon dioxide in the southern ocean between 88°W and 80°E in summer [1995, eng] J-53848
Carbon isotope record in southern ocean sediments [1995, eng] J-53278

Carbon isotopic composition of particulate organic carbon in Ross Sea surface waters during austral summer [1993, eng] **J-51800**
Chemical characteristics of sea water in the Prydz Bay, Antarctica [1994, eng] **J-52280**
Chemical parameters and nutrients in the South Pacific and the Ross Sea [1991, eng] **J-53870**
Chemistry and climatic role of biogenic sulfur: group discussion [1995, eng] **I-53507**
Chemistry of water and ice from Drake Passage and the Bellingshausen Sea [1995, eng] **J-53847**
Circulation variability in Bransfield Strait [1994, eng] **J-52009**
CO_2 air-sea fluxes in the Antarctic Ocean [1995, eng] **J-52649**
CO_2 pressure between Iceland and the Antarctic Peninsula [1995, eng] **J-52650**
Coastal oceanography from Cape Russell to Campbell Ice Tongue [1991, eng] **J-53871**
Data analysis from the summer expedition of 1992-1993 [1994, spa] **J-51742**
Dimethyl sulfide concentrations near the Antarctic Peninsula: November 1992 [1993, eng] **B-52255**
Dimethyl sulfide flux in antarctic and subantarctic oceans, 1988-89 [1995, eng] **J-53198**
Dissolved southern ocean REE [1995, eng] **J-53346**
Distribution of free amino acids in sea- and lake ice cores [1995, eng] **B-53007**
Distribution of nutrients in the Terra Nova Bay and in the Ross Sea [1990, eng] **J-53886**
Distribution of organic particulates in the Ross Sea [1991, eng] **J-53874**
DMS and phytoplankton in the Ross Sea [1995, eng] **J-53823**
Ecology of phytoplankton [1990, eng] **B-53889**
Ecophysiology of polar algae [1995, eng] **B-52872**
Effect of low temperature on BOD in antarctic seawater [1994, eng] **J-51988**
Effects of organic materials on the growth of subantarctic marine bacteria [1994, eng] **B-52588**
Effects of UV radiation on antarctic plankton [1995, eng] **B-53969**
Electrochemical and spectroscopic procedures in sea water chemistry [1995, eng] **J-52981**
Element composition of the cobalt-bearing crusts of the Pacific Ocean [1991, eng] **E-53727**
Environmental changes during the Maastrichtian transition [1994, eng] **J-53322**
Environmental study carried out during the 8th, 9th and 10th Indian antarctic expeditions [1994, eng] **I-53444**
Environments of inlets, coves and lagoons in Admiralty Bay [1994, eng] **J-52215**
Eocene to Oligocene strontium isotope curve [1995, eng] **J-53280**
Expedition ANTARKTIS-XI/2 of RV *Polarstern* in 1993/94 [1995, ger] **E-52536**
Flow of matter in Admiralty Bay [1995, eng] **B-53006**
Forms of occurrence of nitrogen in the Southern Atlantic [1991, eng] **J-53726**
Fulvic acids in the antarctic snow "via marine aerosol" [1994, eng] **F-52655**
Glacial antarctic intermediate water [1994, eng] **J-52747**
Glacial enrichments of Cd and U in subantarctic sediments [1995, eng] **J-53250**
Heavy metal in the antarctic environment [1992, eng] **E-53243**
Helium isotope results from Ice Station Weddell 1 [1993, eng] **J-51797**
Human contamination of Arthur Harbor and McMurdo Sound [1995, eng] **J-53548**
Humic substances in the nitrogen cycle of polar waters [1994, eng] **J-52172**
Hydrographic model of the Atlantic Ocean, 80N to 70S [1995, eng] **J-52506**
Hydrophysical structure of the Second Frontal Zone [1993, rus] **J-53765**
Imperfect retention of natural bacterioplankton cells by glass fiber filters [1995, eng] **B-52584**
Importance of iron for plankton in the southern ocean [1995, eng] **B-52289**
Inorganic nutrient concentrations in near-surface waters around Elephant I., Jan.-Mar. 1993 [1993, eng] **B-52730**
Inorganic nutrients in the marginal ice zone of the Bellingshausen Sea in spring [1995, eng] **J-53846**
Isotopic composition of particulate organic carbon in the South Pacific Ocean [1995, eng] **J-53850**
Italian expedition in the Ross Sea, 1987-1988, Part II [1990, eng] **B-53900**
Lead and cadmium in antarctic seawater [1995, eng] **J-52530**
Lead isotopic study of circum-antarctic manganese nodules [1995, eng] **J-53146**
Long-term dynamics of phytoplankton biomass in the Commonwealth Sea during summers 1977-1988 [1993, rus] **B-53776**
Marginal ice zone chemistry [1995, eng] **B-53277**
Microzooplankton's role in controlling phytoplankton growth [1995, eng] **B-53858**
Netphytoplankton summer distribution in South Atlantic Ocean [1995, eng] **B-52363**
Nitrogen chemistry of polar oceans [1994, ger] **J-52303**
Nitrogen dynamics in the Bellingshausen Sea during the Austral spring of 1992 [1995, eng] **J-53857**
Nutrient cycling by antarctic marine microbial plankton [1995, eng] **B-52161**
Nutrient limitation in Ellis Fjord, eastern Antarctica [1995, eng] **B-52784**
Ocean/atmosphere cycling of dimethylsulfide [1995, eng] **I-53505**
Oceanographic data from JARE-33, Nov. 1991-Mar. 1992 [1995, eng] **J-53130**

Specimen collections
Preatmospheric mass distribution of antarctic and non-antarctic meteorites [1994, eng] E-51657
BIOLOGICAL
Algae in creeks on King George I. [1993, eng] B-53349
Ammonium cycling by antarctic zooplankton in winter [1995, eng] B-52129
"Antarctic 1987/1988" National Program: Oceanographic Campaign 1988 Sorting Center [1990, eng] B-53892
Antarctic and subantarctic Pycnogonida: Ammotheidae and Austrodecidae [1994, eng] B-52120
Antarctic crustacean metabolism as a depth/seasonal function [1994, eng] B-51659
Antarctic fauna [1990, eng] B-53537
Check-list of antarctic and circumantarctic Demospongiae [1991, eng] B-53877
Chlorophyll variations in Weddell Sea microplankton [1993, eng] B-52118
Copepods collected by the Italian expedition of 1987-1988 [1990, eng] B-53902
Demosponges from Terra Nova Bay, 1987-1990 [1994, eng] B-52809
Diurnal vertical migration of antarctic macroplankton [1994, eng] B-52125
Eco-physiological and biochemical approach to the study of antarctic sponges [1991, eng] B-53879
First lichen and moss collections from Heimefront Range [1995, eng] B-53464
First quantitative data on Terra Nova Bay coastal soft bottom bivalve molluscs [1994, eng] B-52812
First quantitative data on Terra Nova Bay coastal soft bottom polychaetes [1994, eng] B-52811
Fossil scleractinian corals from James Ross Basin, Antarctica [1994, eng] E-52119
Littoral benthic communities of Terra Nova Bay: sampling data report [1991, eng] B-53878
Mysidacea (Crustacea) from Kerguelen, Crozet and Bouvet islands collected between 1972 and 1982 [1995, fre] B-52994
New significance for antarctic plant collections and cryptogam taxonomy [1993, eng] B-52346
New Zealand proposal for ecological and taxonomic studies of terrestrial algae [1992, eng] B-53821
Nudibranch molluscs from Signy I. [1995, eng] B-53520
Overwintering strategies of antarctic crustacea [1994, eng] B-51660
Phytobenthos sampling in Terra Nova Bay, 1989-1990 [1991, eng] B-53881
Phytoplankton sediments as indicator of paleoenvironment [1995, eng] E-53310
Ratite bird from the Paleogene La Meseta Formation, Seymour Island, Anarctica [1994, eng] E-53370
Redescription of a mollusc from Signy I. [1995, eng] B-52864
Seasonal photosynthetic variations of brown algae from King George I. [1995, eng] B-53392
Sipuncula of the southeastern Weddell Sea (Antarctica) [1995, eng] B-53107
Survey of stream invertebrate communities on Macquarie Island [1994, eng] B-52457
GEOLOGICAL
Antarctic climate and tectonic history: the Cape Roberts Project [1994, eng] E-52427
Antarctic Marine Geology Research Facility, 1992-1993 [1993, eng] E-53676
Antarctic meteorite newsletter, Vol.18, No.1, Feb. 1995 [1995, eng] E-52708
Antarctic meteorite newsletter, Vol.18, No.2, Aug. 1995 [1995, eng] E-53365
Beryllium-10 and aluminum-26 in individual cosmic spherules from Antarctica [1995, eng] E-54003
Catalog of the antarctic meteorites [1995, eng] E-53362
Collection and curation of IDPs from the Greenland and antarctic ice sheets [1994, eng] E-51839
Geochemistry of bottom sediments in the Weddell Sea [1993, eng] J-52116
Interplanetary dust particles in ice sheets [1994, eng] E-53408
Isotope oxygen distribution within an antarctic outcrop [1994, eng] E-52225
Labile trace elements in antarctic chondrite samples [1995, eng] E-54001
Meteorite recovery and reconnaissance in the Allan Hills—David Glacier region, 1992-1993 [1993, eng] E-51785
Paleomagnetic analysis of Gondwana polar wander in Argentina [1995, eng] L-53080

Paleozoic geologic metamorphism, Larsemann Hills, East Antarctica [1995, eng] E-52477
Rock metamorphosis in the Napier complex, East Antarctica [1994, eng] E-51706
Spectroscopic analysis of antarctic chondrite weathering [1995, eng] E-54002
Thermoluminescence study of the terrestrial ages of antarctic meteorites [1994, eng] E-52166

Spermatophyta
Early Late Permian palynostratigraphy and palaeo-biogeography of Vestfjella, Dronning Maud Land, Antarctica [1995, eng] E-52993
ECOLOGY
Palynological evidence of Miers Bluff Formation age, Antarctica [1994, eng] E-53312
EVOLUTION
Corystosperm pollen organ *Pteruchus* from the Triassic of Antarctica [1995, eng] E-53000
GEOGRAPHIC DISTRIBUTION
Angiosperm-dominated woody vegetation of Antarctica: a review [1995, eng] E-53253
Approach to palynological research in the antarctic continent [1994, eng] B-52546

Diurnal vertical migration of antarctic macroplankton [1994, eng] B-52125
MORPHOLOGY
Cyanophyta of lakes and ponds of Hope Bay [1995, eng] B-53686
Life history, morphology and development of the antarctic brown alga [1995, eng] B-53360
Periphyton flora of some lotic and lentic environments of Hope Bay (Antarctic Peninsula) [1995, eng] B-53411
Taxonomy of *Achnanthes* from freshwater maritime antarctic lakes [1994, eng] B-53249

  - Taxonomy of Cretaceous algae [1994, eng] B-52644
- NUTRITION
  - Bio-optical model of sea-ice algal growth [1994, eng] B-51703
- PATHOLOGY
  - Growth of antarctic cyanobacteria under ultraviolet radiation [1995, eng] B-52873
- PHYSIOLOGY
  - Absorption spectra of Ulotrix sp. and benthic algae at the Great Wall Station [1995, eng] B-53994
  - Acclimatization and fatty acid composition of the alga *Chlorella* [1995, eng] B-53013
  - Accumulation of proline in *Prasiola crispa* during winter in Antarctica [1995, eng] B-52867
  - Analysis of pigments of ice algae in waters near Great Wall Station [1994, eng] B-52275
  - Annual cycle variations of coastal primary productivity and chlorophyll in Admiralty Bay [1993, rus] B-53803
  - Bio-optical model of sea-ice algal growth [1994, eng] B-51703
  - Chlorophyll "a" content in cells of antarctic phytoplankton [1995, eng] B-53416
  - Distribution and composition of phytoplankton in Ardly Bay (King George Island, Antarctica) [1993, eng] B-52117
  - Ecophysiology of polar algae [1995, eng] B-52872
  - Effects of heat shock and UV-B radiation on temperate and antarctic diatoms [1995, eng] B-53082
  - Energy contents and organic constituents in brown algae [1995, eng] B-53934
  - Growth and upper survival temperatures of polar algae [1995, eng] B-52528
  - Growth of antarctic cyanobacteria under ultraviolet radiation [1995, eng] B-52873
  - Heat shock response of an antarctic alga is evident at 5°C [1994, eng] B-51975
  - Krill grazing on *Nitschia* sp. and *Phaeocystis* sp. monocultures [1993, eng] B-52738
  - Life history, morphology and development of the antarctic brown alga [1995, eng] B-53360
  - Lipid composition of antarctic microplankton in relation to the nutrition of krill [1993, eng] B-53274
  - Microalgal light-harvesting in McMurdo Sound [1995, eng] B-53547
  - Mono- and polyunsaturated sedimentary hydrocarbons in the lipids of marine organisms [1995, eng] B-52782
  - Photoinhibition as a regulative mechanism of photosynthesis in marine algae of Antarctica [1994, eng] B-52156
  - Phytoplankton composition and cell carbon distribution in Prydz Bay [1995, eng] B-52797
  - Phytoplankton utilization of ammonium and nitrate in Lake Bonney [1993, eng] B-53051
  - *Polarstern* "ANT X/3" austral autumn in the ice 1992: sea-ice community studies [1993, eng] B-52253
  - Release of volatile halogenated organic compounds by unialgal cultures of polar macroalgae [1995, eng] B-53935
  - Salinity and light effects on sea ice diatoms [1995, ger] B-52535
  - Seasonal photosynthetic variations of brown algae from King George I. [1995, eng] B-53392
- POPULATION
  - Algae of the Schirmacher Hills region [1991, ger] B-52507
  - Benthic marine algal flora of South Georgia [1994, eng] B-53650
  - Biosiliceous sedimentation patterns for the Indian Ocean during the last 45 million years [1992, eng] E-52111
  - Chlorophyll variations in Weddell Sea microplankton [1993, eng] B-52118
  - Determination of past winter temperatures at Ellis Fjord from fast ice diatom assemblages [1994, eng] I-52073
  - Diatoms and dinoflagellates in Terra Nova Bay, summer 1990 [1995, eng] B-53685
  - Distribution and composition of phytoplankton in Ardly Bay (King George Island, Antarctica) [1993, eng] B-52117
  - Distribution of freshwater algae in different habitats around the Great Wall Station [1995, chi] B-53098
  - Diurnal vertical migration of antarctic macroplankton [1994, eng] B-52125
  - Lipid composition of antarctic microplankton in relation to the nutrition of krill [1993, eng] B-53274
  - Nano- and microdiatom distribution in the intertidal zones of Zhongshan Station [1994, chi] B-51733
  - Netphytoplankton summer distribution in South Atlantic Ocean [1995, eng] B-52363
  - Nutrients, algal and cyanobacterial flora of streams from Schirmacher Ponds [1995, eng] B-52828
  - Physical parameters influencing diatom community structure in eastern antarctic sea ice [1994, eng] B-51766
  - Phytoplankton distributions and production in the Bellingshausen Sea, Austral spring 1992 [1995, eng] B-53855
  - Preliminary study on freshwater diatom flora from King George Island, Antarctica [1994, chi] E-53166
  - Quantitative and functional studies of the Terra Nova Bay benthos [1991, eng] B-53880
  - Salinity and light effects on sea ice diatoms [1995, ger] B-52535
  - Seaweeds from Terra Nova Bay [1990, eng] B-53896
  - Structure of phytoplankton communities in the Atlantic sector of the Antarctic [1993, rus] B-53777
  - Summer biogenic silica and organic particulate matter distribution around the South Shetland Is. [1995, eng] J-52365
  - Summer distribution of nano- and microalgae in Prydz Bay and the Indian Ocean [1994, eng] B-52277
  - Vertical distribution of antarctic peninsular macroalgae [1995, eng] B-53981
  - Water column and sea-ice primary production during Austral spring in the Bellingshausen Sea [1995, eng] B-53854
  - Water-mass influences on summer antarctic phytoplankton biomass and community structure [1995, eng] B-52332
- TAXONOMY
  - Algae of the Schirmacher Hills region [1991, ger] B-52507
  - Cyanophyta of lakes and ponds of Hope Bay [1995, eng] B-53686
  - Diatoms and dinoflagellates in Terra Nova Bay, summer 1990 [1995, eng] B-53685
  - Evolution and biogeography of a subantarctic alga [1995, eng] B-53171
  - Freshwater algae of northern Victoria Land [1994, eng] B-52544
  - New Zealand proposal for ecological and taxonomic studies of terrestrial algae [1992, eng] B-53821
  - Periphyton flora of some lotic and lentic environments of Hope Bay (Antarctic Peninsula) [1995, eng] B-53411
  - Preliminary study on freshwater diatom flora from King George Island, Antarctica [1994, chi] E-53166
  - Taxonomic and ecological catalog of diatoms from Argentina and the antarctic insular lakes [1994, spa] B-51736
  - Taxonomy of *Achnanthes* from freshwater maritime antarctic lakes [1994, eng] B-53249
  - Taxonomy of Cretaceous algae [1994, eng] B-52644
  - Vertical distribution of antarctic peninsular macroalgae [1995, eng] B-53981

Thallophyta—Fungi
- ECOLOGY
  - Fungi from mud of antarctic ponds [1994, eng] B-52542
  - Keratinophilic fungi, dermatophytes and anthropization of the Antarctic [1994, eng] B-52543
  - Mycological researches in Victoria Land: terrestrial ecosystems [1994, eng] B-52541
  - Thermophilic fungi and actinomycetes from Mt. Erebus [1983, eng] B-53233
- MORPHOLOGY
  - Mycological researches in Victoria Land: terrestrial ecosystems [1994, eng] B-52541
- PATHOLOGY
  - Keratinophilic fungi, dermatophytes and anthropization of the Antarctic [1994, eng] B-52543
- PHYSIOLOGY
  - Soil microbial community dynamics and enzyme activity in summer [1993, eng] B-53271
  - Thermophilic fungi and actinomycetes from Mt. Erebus [1983, eng] B-53233
- POPULATION
  - Fungi from mud of antarctic ponds [1994, eng] B-52542
  - Marine corrosion of metal alloys of wide technological use in extreme environmental conditions [1991, eng] B-53883
  - Soil microbial community dynamics and enzyme activity in summer [1993, eng] B-53271
  - Survey of total number of bacteria and fungi isolated from the Fildes Peninsula in Antarctica [1994, chi] B-52288
- TAXONOMY
  - Fungi from mud of antarctic ponds [1994, eng] B-52542
  - Late Cretaceous fungal spores from King George Island, Antarctica [1994, chi] E-53155
  - Mycological researches in Victoria Land: terrestrial ecosystems [1994, eng] B-52541

Thallophyta—Lichens
  - Air pollution studies by PIXE and PIGE analysis of lichens [1991, eng] B-52177
  - Photosynthetic activity in a crustose lichen [1994, eng] B-52773
- ECOLOGY
  - Ecophysiology of *Usnea antarctica* in the maritime Antarctic. 1. [1995, eng] B-53463
  - *Japewia tornoensis* (lichenes), a species new to Antarctica [1991, eng] B-51813
  - Lichens from King George I. [1989, eng] B-51862

Microbial succession inside desert rocks [1993, eng] B-51778
GEOGRAPHIC DISTRIBUTION
Botanical studies on Livingston Island [1989, eng] B-51961
Japewia tornoensis (lichenes), a species new to Antarctica [1991, eng] B-51813
Lichens from King George I. [1989, eng] B-51862
MORPHOLOGY
Revision of yellow *Acarosporaceae* (Lichens) from Antarctica [1994, eng] B-52540
PHYSIOLOGY
Chlorophyll fluorescence of antarctic lichens [1995, eng] B-53938
Ecophysiology of *Usnea antarctica* in the maritime Antarctic. 1. [1995, eng] B-53463
Environmental contamination on King George I. [1995, chi] B-53949
Microbial succession inside desert rocks [1993, eng] B-51778
Preliminary data on heavy metals in surface soil and macrolichens of northern Victoria Land [1994, eng] B-52559
Radionuclide deposition in the Antarctic Peninsula area [1994, eng] I-51977
Revision of yellow *Acarosporaceae* (Lichens) from Antarctica [1994, eng] B-52540
TAXONOMY
First lichen and moss collections from Heimefront Range [1995, eng] B-53464
Japewia tornoensis (lichenes), a species new to Antarctica [1991, eng] B-51813
Revision of yellow *Acarosporaceae* (Lichens) from Antarctica [1994, eng] B-52540

Vermes
Sublittoral fauna of Admiralty Bay [1990, ger] B-53694

BREEDING CYCLES AND REPRODUCTION
Winter population structure and feeding of chaetognaths and copepods in Gerlache Strait [1995, eng] B-52583

ECOLOGY
Communities of epibiota on two erect species of antarctic bryozoa [1994, eng] B-52136
First quantitative data on Terra Nova Bay coastal soft bottom polychaetes [1994, eng] B-52811
Genetics and ecology of the nematode endoparasites *Contracaecum* and *Pseudoterranova* in the polar regions [1994, eng] B-52552
Nematodes, rotifers and tardigrades from nunataks in Queen Maud Land [1995, eng] B-52337
Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] B-51767
Spatial distribution of nematodes in polar desert soils of Antarctica [1995, eng] B-53108
Terrestrial invertebrates in the Asuka Station area [1995, eng] B-53012

EVOLUTION
Genetics and ecology of the nematode endoparasites *Contracaecum* and *Pseudoterranova* in the polar regions [1994, eng] B-52552
Isozyme variation and taxonomic rank of *Contracaecum radiatum* (v. Linstow, 1907) [1995, eng] B-52631

GEOGRAPHIC DISTRIBUTION
Antarctic marine worms collected in 1986 [1992, ger] B-52079
Cyphonautes larva (Bryozoa: Gymnolaemata) from the Bellingshausen Sea, Antarctica [1995, eng] B-53522
First quantitative data on Terra Nova Bay coastal soft bottom polychaetes [1994, eng] B-52811
Genetics and ecology of the nematode endoparasites *Contracaecum* and *Pseudoterranova* in the polar regions [1994, eng] B-52552
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] B-52548
Polychaeta "Sedentaria" from Terra Nova Bay: Capitellidae to Serpulidae [1995, eng] B-52787
Sipuncula of the southeastern Weddell Sea (Antarctica) [1995, eng] B-53107
Spatial distribution of nematodes in polar desert soils of Antarctica [1995, eng] B-53108

MIGRATION
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] B-53891

MORPHOLOGY
Cyphonautes larva (Bryozoa: Gymnolaemata) from the Bellingshausen Sea, Antarctica [1995, eng] B-53522

Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] **B-51767**
Plectus antarcticus de Man from western Queen Maud Land [1995, eng] **B-53128**
Polychaeta "Sedentaria" from Terra Nova Bay: Capitellidae to Serpulidae [1995, eng] **B-52787**
Seasonal and annual growth in erect species of antarctic bryozoans [1995, eng] **B-53234**
Sipuncula of the southeastern Weddell Sea (Antarctica) [1995, eng] **B-53107**

NUTRITION
Seasonality of feeding activity in antarctic suspension feeders [1995, eng] **B-53109**
Winter population structure and feeding of chaetognaths and copepods in Gerlache Strait [1995, eng] **B-52583**

PATHOLOGY
Winter population structure and feeding of chaetognaths and copepods in Gerlache Strait [1995, eng] **B-52583**

PHYSIOLOGY
Genetics and ecology of the nematode endoparasites *Contracaecum* and *Pseudoterranova* in the polar regions [1994, eng] **B-52552**
Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] **B-51767**
Seasonal and annual growth in erect species of antarctic bryozoans [1995, eng] **B-53234**
Survival of intracellular freezing by the antarctic nematode *Panagrolaimus davidi* [1995, eng] **B-53532**

POPULATION
Antarctic marine worms collected in 1986 [1992, ger] **B-52079**
Communities of epibiota on two erect species of antarctic bryozoa [1994, eng] **B-52136**
Epibiotic communities on sublittoral macroinvertebrates at Signy Island, Antarctica [1995, eng] **B-53755**
First quantitative data on Terra Nova Bay coastal soft bottom polychaetes [1994, eng] **B-52811**
Nematodes, rotifers and tardigrades from nunataks in Queen Maud Land [1995, eng] **B-52337**
Quantitative and functional studies of the Terra Nova Bay benthos [1991, eng] **B-53880**
Spatial distribution of nematodes in polar desert soils of Antarctica [1995, eng] **B-53108**
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] **B-53891**

TAXONOMY
Antarctic marine worms collected in 1986 [1992, ger] **B-52079**
Cyphonautes larva (Bryozoa: Gymnolaemata) from the Bellingshausen Sea, Antarctica [1995, eng] **B-53522**
Isozyme variation and taxonomic rank of *Contracaecum radiatum* (v. Linstow, 1907) [1995, eng] **B-52631**
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] **B-52548**
Occurrence of *Pseudoterranova decipiens* (Nematoda) in fish from the southeastern Weddell Sea (Antarctic) [1994, eng] **B-51767**
Plectus antarcticus de Man from western Queen Maud Land [1995, eng] **B-53128**
Polychaeta "Sedentaria" from Terra Nova Bay: Capitellidae to Serpulidae [1995, eng] **B-52787**
Sipuncula of the southeastern Weddell Sea (Antarctica) [1995, eng] **B-53107**
Spatial distribution of nematodes in polar desert soils of Antarctica [1995, eng] **B-53108**

Visibility
Whiteout! [1994, eng] **I-51702**

VLF emissions
Case study of storm commencement and recovery plasmaspheric electric fields near L=2.5 at equinox [1994, eng] **K-52033**
Natural low- medium- and high-frequency radio emissions from remote sites [1993, eng] **K-53664**
Satellite Experiments Simultaneous with Antarctic Measurements (SESAME) [1995, eng] **K-52976**
Simple theoretical model for computing omega navigation errors near Antarctica [1995, eng] **K-52852**

GEOGRAPHIC INDEX

Aboa Station
- Finland's report to SCAR, Aug. 1994 [1994, eng] **A-52404**

Adams Island
- New Zealand's subantarctic islands: a guidebook [1991, eng] **A-53420**

Adamson, Mount
- Boggsite and tschernichite-type zeolites from Mt. Adamson [1995, eng] **E-53689**

Adare, Cape
- Polar excavation techniques and technology [1989, eng] **A-53422**

Adelaide Island
- Plankton as an indicator of water transport in the Antarctic [1994, eng] **B-52521**
- Seismic modelling of the Earth's crust structure in the Adelaide I. region [1994, eng] **L-52214**

Adélie Coast
- Antarctica and Adélie Land [1990, fre] **A-52349**
- Anthropogenic lead isotopes in Antarctica [1994, eng] **F-51834**
- Interactions between katabatic winds and polynyas at the Adélie Coast [1995, eng] **I-53470**
- Katabatic winds in Adélie Coast [1993, eng] **I-52141**
- Kernlose winter in Adélie Coast [1993, eng] **I-52146**
- Origin of present-day antarctic precipitation from surface snow deuterium excess data [1995, eng] **I-53692**
- Origins and variations of light carboxylic acids in polar precipitation [1995, eng] **I-52091**
- Record of Chinstrap penguins breeding on Adélie Coast [1994, eng] **B-54006**

Admiralty Bay
- *Acanthodraco dewitti* n.sp. (Pisces, Bathydraconidae) from Admiralty Bay [1995, eng] **B-53817**
- Annual cycle variations of coastal primary productivity and chlorophyll in Admiralty Bay [1993, rus] **B-53803**
- Antarctic fish gill under salinity stress [1995, eng] **B-53698**
- Chlorophyll *a*, suspended organic carbon and silicon in the sea ice of Admiralty Bay [1993, rus] **F-53797**
- Continuing studies of the demography and foraging behavior of the *Pygoscelis* penguins [1993, eng] **B-52266**
- Embryogenesis of *Notothenia neglecta* Nybelin in Admiralty Bay [1993, eng] **B-53088**
- Environments of inlets, coves and lagoons in Admiralty Bay [1994, eng] **J-52215**
- Flow of matter in Admiralty Bay [1995, eng] **B-53006**
- Influence of acclimatization and substratum on the metabolism of two amphipods [1995, eng] **B-52599**
- Phytoplankton annual cycle in King George I. [1993, eng] **B-53348**
- Phytoplankton primary productivity in antarctic waters [1993, rus] **B-53802**
- Seasonal changes in composition of suspended matter in Admiralty Bay [1993, eng] **B-53085**
- Sublittoral fauna of Admiralty Bay [1990, ger] **B-53694**
- Transport of metal elements from land to coastal zone of antarctic shelf waters [1994, eng] **J-52219**
- Upper Cretaceous leaf flora from King George I. [1994, pol] **E-53129**

Admiralty Sound
- New bacterial strain of Antarctica, *Alteromonas* sp. that produces a heteropolymer slime [1994, eng] **B-51770**

Alexander Island
- Accreted oceanic material on Alexander I. [1992, eng] **E-51809**
- Deformation mechanisms in accreted oceanic rocks [1994, eng] **E-52707**
- Fossil bivalves from the Antarctic Peninsula region [1995, eng] **E-52399**
- New trigonioid bivalves from the Albian (Early Cretaceous) of Alexander I. [1995, eng] **E-52591**
- Tertiary palynomorphs from the Le May Group, Alexander I. [1994, eng] **E-53446**
- Upper Jurassic methane-seep limestone from the Fossil Bluff Group forearc basin of Alexander Island, Antarctica [1995, eng] **E-52986**
- Valley asymmetry on southeastern Alexander I. [1994, eng] **E-53818**

Allan Hills
- Meteorite recovery and reconnaissance in the Allan Hills—David Glacier region, 1992-1993 [1993, eng] **E-51785**
- Meteorites as time markers on antarctic blue ice fields [1995, eng] **E-54009**
- Meteoritic thermoluminescence, climatic change and ice thickness in the Quaternary Allan Hills [1993, eng] **E-51786**
- Mössbauer spectroscopic study of meteorites recovered on Antarctica [1994, eng] **E-53586**
- Record of fluid-rock interactions on Mars from the meteorite ALH84001 [1994, eng] **E-51808**
- Tetrataenite in metallic grains of the antarctic L6 chondrite ALHA 76009 [1994, eng] **E-53585**

Amery Ice Shelf
- Flow regime of the Lambert Glacier-Amery Ice Shelf system [1994, eng] **F-52951**
- Morphology and late glacial history of Prydz Bay, Antarctica, based on echo sounder data [1994, eng] **E-51940**

Amsterdam Island
- Alternate long and short foraging trips in pelagic seabird parents [1994, eng] **B-51974**
- PCB ocean pollution at Saint Paul and Amsterdam Is. [1995, eng] **J-53517**
- Sex-specific and latitudinal variance in postnatal growth of the subantarctic fur seal [1994, eng] **B-52472**

Amundsen Sea
- Antarctic journal of the United States, vol.29, no.1 [1994, eng] **A-53566**
- Benthos in polar waters [1995, ger] **B-52342**
- Depositional environment of the snow cover on West Antarctic pack-ice floes [1994, eng] **F-52894**
- Glacial-ice fragments in antarctic sea ice [1995, eng] **F-53643**
- Modulation of hemispheric sea-ice cover by ENSO events [1995, eng] **F-52178**
- Polar news/Notizie polari, Vol.10, No.2 [1995, eng] **A-52664**
- Swedish Antarctic Research Programme 1993/94; a cruise report [1995, eng] **A-52640**

Amundsen-Scott Station
- 10-century comparison of prominent bipolar volcanic events in ice cores [1995, eng] **F-53659**
- 1994-1995 antarctic field season [1995, eng] **A-53542**
- Aerosol absorption measurements at Barrow, Mauna Loa and the South Pole [1995, eng] **I-52885**
- Analysis of wastewater from Amundsen-Scott Station [1994, eng] **A-52205**
- Antarctic high-latitude mesospheric dynamics [1995, eng] **K-53204**
- Antarctic stratospheric spectroscopy using N_2O observations [1995, eng] **I-53997**
- Atmospheric longwave radiation and temperature profiles at Amundsen-Scott Station [1993, eng] **I-53065**
- Atmospheric measurements of HCFC-22 at the South Pole [1993, eng] **I-53064**
- Carbon monoxide in the antarctic atmosphere: observations of decreasing concentrations [1993, eng] **I-53063**
- CO_2 evolution during the last millennium as recorded by antarctic and Greenland ice [1995, eng] **I-52651**
- Conversion kinetics in antarctic ice [1995, eng] **F-52636**
- Correlation of tidal gravity anomalies and heat flow densities [1995, eng] **L-52988**
- Cosmic microwave background anisotropy [1995, eng] **K-52792**
- Cosmic microwave background measurements at Amundsen-Scott Station [1993, eng] **K-53665**
- Crust-mantle structure under South Pole and Ross Sea beach in Antarctica [1994, chi] **L-51746**
- Decline in polar stratospheric ozone as observed by NOAA infrared sounders [1993, eng] **I-52804**
- Diurnal tide in the antarctic and arctic mesosphere/lower thermosphere regions [1995, eng] **I-52101**
- Episodic events in the antarctic atmospheric boundary layer [1993, eng] **I-53067**
- Feasibility of long-term vertical electric current measurements in the Antarctic [1993, eng] **K-53669**
- Feasibility tests and design of AMANDA (Antarctic muon and neutrino detector array) [1993, eng] **K-53002**
- GCM simulations of atmospheric tracers in Antarctica and Greenland [1995, eng] **I-52133**
- Gravity wave activity in the stratosphere and mesosphere at the South Pole [1995, eng] **I-53205**
- Helioseismology from the South Pole: closer connections with geoseismology [1993, eng] **K-53673**
- High latitude aspects of a differential GPS aircraft landing system [1994, eng] **G-53636**
- Increased atmospheric CO_2 since 1980 [1995, eng] **I-52970**
- Infrared atmospheric absorption and emission studies [1993, eng] **I-53059**
- Lidar studies of the middle atmosphere structure and dynamics [1994, eng] **I-52998**

Salp and krill distribution near the South Shetlands during summer 1990-1991 [1995, eng] B-52334
Sediments of Bransfield Strait and NW Weddell Sea [1994, eng] J-52579
Seismic facies investigation of the Late Cenozoic glacial history of Bransfield Basin, Antarctica [1994, eng] E-51901
Spring plankton community respiration in Bransfield Strait [1995, eng] J-53989
Structure of phytoplankton communities in the Atlantic sector of the Antarctic [1993, rus] B-53777
Tectonic evolution of the Bransfield Strait [1994, eng] E-51902
Tides in Bransfield Strait [1994, eng] J-52011
Vertical distribution of phytoplankton biomass in the South Atlantic Ocean (Feb.-Apr.) [1993, rus] B-53779

Brattstrand Bluffs
Melting metapelites at Brattstrand Bluffs [1995, eng] E-53742

Brialmont Cove
Transport of suspended particulate matter in an antarctic fjord [1994, eng] J-51984

Brimstone Peak
Origin of the moraines between Griffin Nunatak and Brimstone Peak, southern Victoria Land [1993, eng] E-51674

Browning Pass
Petrogenesis of the McMurdo Volcanic Group and crust-mantle evolution in Victoria Land [1994, eng] E-53034

Budd Coast
Recent discovery of a breeding colony of emperor penguins on the Budd Coast [1995, eng] B-53749

Bunger Hills
Biogeochemical processes in Bunger Hills waters [1995, eng] E-52449
Ice margin form, structure and stability, Vestfold and Bunger Hills [1995, eng] F-52839
Martian analogs in antarctic lakes [1995, eng] F-52618
Studies of Cainozoic environmental change in Tasmania and coastal Antarctica: a review [1993, eng] F-51864

Butcher Ridge
Aeromagnetic profile over Butcher Ridge [1995, eng] L-53916

Byrd Glacier
Decay of surface topography on the Ross Ice Shelf, Antarctica [1994, eng] F-52928
Katabatic winds along the Transantarctic Mountains [1993, eng] I-52143

Byrd Station
10-century comparison of prominent bipolar volcanic events in ice cores [1995, eng] F-53659
Conversion kinetics in antarctic ice [1995, eng] F-52636
Electrical conductivity dating of the Byrd Station ice core [1994, eng] F-52907
Mapping c-axis fabrics to study physical processes in ice [1995, eng] F-52789
Method for determining ice-thickness change at remote locations using GPS [1994, eng] F-52930
Post-drilling recrystallization of the Byrd Station deep ice core [1994, eng] F-52925

Caird Coast
History of place-names in the British Antarctic Territory [1991, eng] A-52574

Campbell Island
New Zealand's subantarctic islands: a guidebook [1991, eng] A-53420

Campbell Ridges
Convection at the interface between layers of mafic and silicic magma, Campbell Ridges [1995, eng] E-53358

Casey Station
Australian antarctic middle and upper atmospheric physics: a new direction [1995, eng] K-53209
Current ANARE machinery and vehicles [1992, eng] G-52456
Soil organic matter composition and transformation in gelic histosols of coastal continental Antarctica [1995, eng] E-53814

Chad, Lake
Hydrologic and geochemical consequences of the merging of Lake Chad with Lake Hoare [1993, eng] B-53055

Charlie, Dome
Concordia Station [1994, eng] G-53435
Electrical resistivity sounding of the East Antarctic ice sheet [1995, eng] F-52509
Holocene temperature variations inferred from six antarctic ice cores [1994, eng] F-52955

Mercury in ancient ice and recent snow from the Antarctic [1995, eng] F-53512
Temporal variations of microwave brightness temperatures over Antarctica [1994, eng] F-52892

Charlotte Bay
Biogenic production of dimethyl sulfide: krill grazing [1993, eng] B-52260
Dimethyl sulfide concentrations near the Antarctic Peninsula: November 1992 [1993, eng] B-52255

Clark Peninsula
Chlorophyll fluorescence of antarctic lichens [1995, eng] B-53938

Clayton Ramparts
Glacial geology of the Shackleton Range [1995, eng] E-53976

Coats Land
Antarctic snow record of southern hemisphere lead pollution [1994, eng] F-53289

Cockburn Island
Upper Cretaceous calcareous nannoplankton from the *Pecten* Conglomerate on Cockburn I. [1994, eng] E-52669

Collins Harbor
Benthic environment and adaptive strategy of the bivalve *Laternula elliptica* [1994, eng] B-52071

Comandante Ferraz Station
Brazil in Antarctica [1994, por] A-52671
Brazilian network observations of the 1992 ozone hole [1993, eng] I-53651

Convoy Range
Glacier disequilibrium in the Convoy Range, Transantarctic Mountains, Antarctica [1994, eng] F-52931

Coulman Island
Diving behavior of Emperor Penguins nurturing chicks at Coulman Island, Antarctica [1995, eng] B-53014

Crary Mountains
Geochronology of the Crary Mountains volcanos [1993, eng] E-51665

Croker Passage
Copepoda (Cyclopoida) from the Croker Passage (Antarctica, June-August, 1989) [1993, eng] B-53087
Seasonal and diel changes in the abundance and vertical distribution of 5 copepod species from Croker Passage [1993, eng] B-52854
Variations in the population and life histories of 5 copepod species from Croker Passage [1993, eng] B-52853

Crozet Archipelago
Biochemistry of fasting macaroni penguins during molt [1994, eng] B-53323

Crozet Island
Taxonomy of petrels related to vocalizations [1995, eng] B-52576

Crozet Islands
Alternate long and short foraging trips in pelagic seabird parents [1994, eng] B-51974
Artifacts arising from sampling interval in dive depth studies of marine endotherms [1995, eng] B-53931
Aves nutrition at Crozet Is. [1994, eng] B-52626
Diving depth and patterns in Gentoo penguins from Crozet Is. [1994, eng] B-54005
Endocrine basis of the reproductive pattern of the Gentoo penguin [1995, eng] B-52881
Influence of reproductive success on breeding frequency in four southern petrels [1995, eng] B-53705
King penguin nutrition during the prebreeding and premoulting foraging periods [1995, eng] B-52596
Magnetic observations made at Port Alfred, Crozet Is., 1984 [1986, fre] L-52379
Satellite monitoring of king penguin population increase on Crozet Is. [1995, eng] B-53687
Seasonal and fast-related metabolic changes in King Penguins [1994, eng] B-52833
Wandering albatross and longline fishing [1994, eng] B-52171

Cuff Cape
Subrecent moraine ridge formation on Cuff Cape, Victoria Land, Antarctica [1995, eng] E-53104

Dakshin Gangotri Station
Environmental study carried out during the 8th, 9th and 10th Indian antarctic expeditions [1994, eng] I-53444

Dallmann Bay
Aerobic energy metabolism in antarctic fish [1995, eng] B-52825
Polycyclic aromatic hydrocarbon metabolites obtained from fish injected with Diesel Fuel Arctic [1995, eng] B-53582

Danco Coast
Terrestrial ecology of Danco Coast [1995, spa] B-53963

David Glacier
Glacial history of the area between the David and Mawson glaciers [1994, eng] F-52898
Meteorite recovery and reconnaissance in the Allan Hills—David Glacier region, 1992-1993 [1993, eng] E-51785

Davis Station
Antarctic planktonic biomass seasonal variations [1995, eng] B-53867
Australian antarctic lidar facility [1994, eng] G-53474
Australian antarctic middle and upper atmospheric physics: a new direction [1995, eng] K-53209
Current ANARE machinery and vehicles [1992, eng] G-52456
Distribution of free amino acids in sea- and lake ice cores [1995, eng] B-53007
Hydrocarbons and sterols in marine sediments and soils at Davis Station [1995, eng] B-52835
Newsletter, No.29, June 1992 [1992, eng] A-52672
Quasi-periodic scintillation events at southern auroral latitudes [1994, eng] K-53661

Deception Island
Lipid composition of antarctic microplankton in relation to the nutrition of krill [1993, eng] B-53274
Microbes in the area of the South Shetland Islands [1994, eng] B-52273
Nest maintenance and stone theft in the Chinstrap penguin. Part 1 [1995, eng] B-53927
Nest maintenance and stone theft in the Chinstrap penguin. Part 2 [1995, eng] B-53928
Penguin nest defense against intruders [1995, eng] B-53304

Deception Plateau
Petrogenesis of the McMurdo Volcanic Group and crust-mantle evolution in Victoria Land [1994, eng] E-53034

Deep Freeze Range
Geochemistry and Sr-Nd isotopes of amphibolite dykes of northern Victoria Land, Antarctica [1995, eng] E-53223

Dismal Ridge
Petrogenesis of carbonate-bearing nepheline syenites and carbonatites from Victoria Land [1995, eng] E-53222

Dolleman Island
340 year record of biogenic sulphur from the Weddell Sea area, Antarctica [1995, eng] F-53495

Dominion Range
Late Holocene ice core history of the TAM [1995, eng] F-53919

Don Juan Pond
Historical aspects of Lake Vanda and Don Juan Pond [1995, eng] E-53920

Dotson Ice Shelf
Velocities of the Smith Glacier tongue and Dotson Ice Shelf [1994, eng] F-52905

Drake Passage
Chemistry of water and ice from Drake Passage and the Bellingshausen Sea [1995, eng] J-53847
Comparison between FRAM results and observations [1995, eng] J-53305
Effect of Drake Passage on the global thermohaline circulation [1995, eng] J-53307
Effects of partial meridional barriers on the Antarctic Circumpolar Current—Wind-driven barotropic model [1994, eng] J-51716
Evolution and biogeography of a subantarctic alga [1995, eng] B-53171
Humic substances in the nitrogen cycle of polar waters [1994, eng] J-52172
Nitrogen chemistry of polar oceans [1994, ger] J-52303
On the meridional extent and fronts of the Antarctic Circumpolar Current [1995, eng] J-53824
On the southerly extent of the Antarctic Circumpolar Current in the southeast Pacific [1995, eng] J-53841
South Atlantic circulation in a world ocean model [1994, eng] J-52006
Temperature, salinity and geostrophic flow along 60°W in Jan. 1988 [1995, eng] J-53011

Drygalski Ice Tongue
20th century behaviour of Drygalski Ice Tongue, Ross Sea, Antarctica [1994, eng] F-52950
Mass diffusion effects from antarctic ice shelf melting [1994, eng] F-52128

Dumont d'Urville Station
K-Ar ages of igneous and metamorphic rocks from McMurdo, Sør Rondane and Dumont d'Urville, Antarctica [1994, eng] E-52027
Magnetic observations made at the Dumont d'Urville Observatory, Adélie Coast, 1986 [1988, fre] L-52380
Multiwavelength and depolarization stratospheric lidar measurements [1994, eng] I-52500
Newsletter, No.30, Sep. 1992 [1992, eng] A-52673
Outgoing longwave radiation, surface temperature and sea ice [1993, eng] I-52184
Ozone and aerosols lidar measurements in 1991 and 1992 in Dumont d'Urville [1994, eng] I-52499
Polar lacuna on ionograms. I: Brief morphology [1994, eng] K-53385
Radiometric profiler for antarctic atmospheric profiling [1994, eng] I-51852
Unusual PSCs observed by lidar in Antarctica [1995, eng] I-53720

Dyer Plateau
Chemical analysis of Dyer Plateau ice cores [1995, eng] F-53496
Climate change on Dyer Plateau [1994, eng] F-52954

East Antarctica
Aerobic energy metabolism in antarctic fish [1995, eng] B-52825
Contrasting P-T-t loops from southern East Africa, Natal and East Antarctica [1994, eng] E-52984
Direct imaging of planetary systems with a ground-based radiotelescope array [1994, eng] K-51859

Geologic metamorphoses in East Antarctica [1995, eng] **E-52115**
Improved method for decontaminating polar snow or ice cores for heavy metal analysis [1994, eng] **F-52182**
Influence of retrograde cation exchange on granulite *P-T* estimates and recovery of metamorphic conditions [1994, eng] **E-51979**
Interaction of katabatic winds and the formation of blue-ice areas in East Antarctica [1995, eng] **F-53640**
Isotope oxygen distribution within an antarctic outcrop [1994, eng] **E-52225**
Origins of Yamato Mountains syenites [1995, eng] **E-53347**
Palynology of the Mackellar Formation (Beacon Supergroup) of East Antarctica [1994, eng] **E-51821**
Palynostratigraphy of the Mackellar Formation (Beacon Supergroup), East Antarctica [1993, eng] **E-51675**
Petrology of the Shackleton Range [1994, eng] **E-52823**
Preservation of Miocene glacier ice in Antarctica [1995, eng] **E-53214**
Proposed connection between East Antarctica and Gondwanaland [1995, eng] **E-53151**
Proximal sub ice-shelf sedimentation, Jutulgryta, East Antarctica [1994, eng] **F-52608**
Rock metamorphosis in the Napier complex, East Antarctica [1994, eng] **E-51706**
Satellite radar altimetry of the east antarctic ice sheet [1994, eng] **F-52910**
Scientific potential for astronomy from the Antarctic Plateau [1994, eng] **G-51856**
Seasonal changes of sea-ice characteristics off East Antarctica [1994, eng] **F-52919**
Snow accumulation rate from synthesis of microwave and altimeter data [1995, eng] **F-53597**
Substances deposited on an inland plateau, Antarctica [1994, jpn] **F-52568**
Two-step shape and timing of the last deglaciation in Antarctica [1995, eng] **I-53041**

East Ongul Island
Step frequency radar experiments on the antarctic sea ice [1988, eng] **F-52038**

Edward VII Peninsula
Anorogenic granites of Marie Byrd Land [1992, eng] **E-53379**
Geochronology of Cretaceous granites and metasedimentary basement on Edward VII Peninsula [1995, eng] **E-53465**
Geological expedition to King Edward VII Peninsula and the Ford Ranges, Marie Byrd Land [1993, eng] **E-51666**

Ekström Ice Shelf
Ekström grounding line experiments—first results [1994, eng] **F-52299**
Hot water drilling to the ocean beneath Ekström Ice Shelf [1994, eng] **F-52906**
Parameterization of the downward long-wave radiation at the Earth's surface in polar regions [1994, eng] **I-52167**
Remote sensing of antarctic ice shelves (Extended abstract) [1989, eng] **F-53382**
Tidal induced melting of the Ekström Ice Shelf in the southeastern Weddell Sea [1994, eng] **J-52295**

Elephant Island
Acoustic estimates of krill biomass in the Elephant Island area: 1981-1993 [1994, eng] **A-51991**
Additional collection of antarctic starfishes [1992, ger] **B-52077**
AMLR program: Foraging behavior and spatial pattern of pelagic birds at sea [1993, eng] **B-52731**
AMLR program: Krill and macrozooplankton in the Elephant Island area, January to March 1993 [1993, eng] **B-52726**
AMLR program: Rates of primary production around Elephant Island, Antarctica [1993, eng] **B-52728**
ANTARKTIS XII expedition report, Leg 2 [1995, ger] **D-54033**
Biomass estimates of *Euphausia superba* [1995, eng] **B-53306**
Feeding and ecology of fish near Elephant I., winter 1986 [1994, eng] **B-53248**
Inorganic nutrient concentrations in near-surface waters around Elephant I., Jan.-Mar. 1993 [1993, eng] **B-52730**
Interannual variability in the Elephant I. surface waters in summer [1993, eng] **J-52733**
Krill abundance and distribution around Elephant I. in summer of 1993 [1993, eng] **B-52725**
New antarctic stenothoids [1992, ger] **B-52078**
Nitrogen and noble gases in a glass sample from the LEW88516 shergottite [1993, eng] **E-52174**
Phytoplankton distribution and biomass around Elephant I., Jan.-Mar. 1993 [1993, eng] **B-52729**
Phytoplankton distribution and primary productivity variability around Elephant I., 1990-1993 [1995, eng] **B-52781**
Recruitment and variability in antarctic krill [1995, eng] **B-53599**
Status of the krill stock around Elephant Island in 1991/92 and 1992/93 [1994, eng] **B-51992**
Taxonomy of *L. squamiformes* in the antarctic environs [1919, eng] **B-53942**
Ultraviolet and visible solar irradiance around Elephant I., Jan.-Mar. 1993 [1993, eng] **I-52727**
Variability in nutrient concentrations around Elephant Island, Antarctica, during 1991-1993 [1995, eng] **J-53812**

Ellis Fjord
Determination of past winter temperatures at Ellis Fjord from fast ice diatom assemblages [1994, eng] **I-52073**
Nutrient limitation in Ellis Fjord, eastern Antarctica [1995, eng] **B-52784**

Ellsworth Land
Petrology of eastern Ellsworth Land [1995, eng] **E-53921**

Ellsworth Mountains
Geologic and fission-track studies in West Antarctica [1993, eng] **E-51680**
Gondwanaland Province from 360 Ma to 160 Ma [1994, eng] **E-52463**
Permian-Triassic Transantarctic basin [1994, eng] **E-52462**

Enderby Land
Temperature structure and polynyas in the Cosmonaut Sea [1994, eng] **F-52935**

Erebus Bay
Physiological and behavioral ecology of juvenile Weddell seals [1993, eng] **B-52268**

Erebus Glacier
Sensitive and robust strain-meter for ice studies [1994, eng] **G-52603**

Erebus, Mount
Classification of volcanic earthquakes at Mount Erebus, Antarctica [1989, eng] **L-53544**
Compositions and mass fluxes of the Mount Erebus volcanic plume [1994, eng] **E-52437**
Crystallization processes of anorthoclase phenocrysts in the Mount Erebus magma [1994, eng] **E-52441**
Deformation monitoring of Mt. Erebus, Antarctica, 1980-1985 [1989, eng] **E-53546**
Dispersal of volcano-derived particles from Mount Erebus in the antarctic atmosphere [1994, eng] **E-52438**
Elemental tracers of volcanic emissions from Mount Erebus in antarctic snow samples [1994, eng] **E-52439**
Erebus expedition [1994, fre] **D-53475**
Glaciochemical studies of aerosol fallout from Mount Erebus [1994, eng] **F-52440**
Infrasonic recordings of Strombolian eruptions of Erebus, Mar.-Dec. 1984 [1989, eng] **L-53545**
Mineralogy and geochemistry of Mount Erebus eruptions, 1972-1986 [1994, eng] **E-52442**
Monitoring Mount Erebus by satellite remote sensing [1994, eng] **E-52434**
Mount Erebus Volcano Observatory: seismic observations [1993, eng] **L-51667**
Polar news/Notizie polari, Vol.10, No.4 [1995, ita] **A-52959**
Seismic activity of Mount Erebus in 1981-1990 [1994, eng] **L-52433**
Sulfur dioxide emission rates from Mount Erebus, Antarctica [1994, eng] **E-52436**
Thermophilic fungi and actinomycetes from Mt. Erebus [1983, eng] **B-53233**
Velocity modeling in the erupting magma column of Mount Erebus, Antarctica [1994, eng] **L-52432**
Velocity structure of Mount Erebus, Antarctica, and its lava lake [1994, eng] **L-52431**
Volcanic deformation monitoring on Mount Erebus: methods and results of geodetic surveys, 1980-1985 [1994, eng] **E-52435**
Volcanological and environmental studies of Mount Erebus, Antarctica [1994, eng] **E-52430**

Evans, Cape
Polar excavation techniques and technology [1989, eng] **A-53422**

Factory Cove
Adaptation of the benthic microbial community in an inshore coastal sediment at Signy I. [1993, eng] **B-53273**

Falkland Islands
Additional collection of antarctic starfishes [1992, ger] **B-52077**
Chick loss in the Falklands skua [1995, eng] **B-52577**
Cladistic placement of the subantarctic genus *Haversiella* (Coleoptera: Curculionidae) [1994, eng] **B-53580**
Early Falkland Is. sealing [1990, eng] **A-51863**
Evolution and biogeography of a subantarctic alga [1995, eng] **B-53171**
Expedition ANTARKTIS-XI/2 of RV *Polarstern* in 1993/94 [1995, ger] **E-52536**
Fish offal as albatross food [1995, eng] **B-52575**
Genetic population structure of beetles from South Georgia and the Falkland Is. [1995, eng] **B-53688**
Juvenile cephalapods in Falkland I. waters [1994, eng] **B-52771**
Kelp rafting: a subantarctic dispersal mechanism [1994, eng] **B-52516**
New species of liparidid fishes of the genus *Careproctus* [1992, eng] **B-53609**
Oceanic tides in the South Atlantic Ocean [1994, eng] **J-52010**
Pelagic communities of seabirds in the South Atlantic Ocean [1995, eng] **B-52175**
Winter distribution of a Patagonian squid [1990, eng] **B-51817**

Faraday Station
Case study of storm commencement and recovery plasmaspheric electric fields near L=2.5 at equinox [1994, eng] **K-52033**
Effect of disturbed-time electric fields on the inner plasmasphere [1994, eng] **K-53384**

Foraminifera from the surface sediments in the Great Wall Bay [1994, chi] **B-53167**
Fossil marine bivalves from the Great Wall Bay [1994, chi] **E-53168**
Geochemistry of Late Quaternary core from a lake on King George I. [1994, eng] **E-51726**
Preliminary study of the phytoplankton ecology in the Great Wall Bay, Antarctica [1994, eng] **B-52276**
Record of ostracoda from the Great Wall Bay of King George Island, Antarctica [1994, chi] **B-53169**
Surface meteorological data at Great Wall Station, Antarctica 1988-1992 [1993, eng] **I-51709**
Survey of total number of bacteria and fungi isolated from the Fildes Peninsula in Antarctica [1994, chi] **B-52288**
Survey on changes of multiple humoral factors in antarctic expedition members [1994, eng] **H-51723**
Zooplankton composition and variation in waters near Great Wall Station [1994, eng] **B-52274**

Griffin Nunatak
Origin of the moraines between Griffin Nunatak and Brimstone Peak, southern Victoria Land [1993, eng] **E-51674**

Grunehogna Peaks
Sill emplacements in wet sediments [1994, eng] **E-53561**

Half Moon Island
Geomorphological map of Half Moon I., South Shetland Is. [1994, spa] **E-52814**

Halley Bay
Theoretical model of atmospheric ozone depletion [1995, eng] **I-52793**

Halley Station
Case study of turbulent parameters during the antarctic winter [1995, eng] **I-53960**
Continued decline of total ozone over Halley, Antarctica, since 1985 [1995, eng] **I-53215**
House on skis for BAS [1995, eng] **G-52647**
Improved use of passive microwave data for sea ice detection [1992, eng] **F-53615**
Ionospheric plasma convection in the Southern Hemisphere [1995, eng] **K-52850**
Mean thermospheric winds observed from Halley, Antarctica [1994, eng] **K-52031**
Modelling mass and energy exchange over polar snow using the DAISY model [1994, eng] **F-52189**
New mechanism for polar patch formation [1994, eng] **K-51829**
Night-shift work in Antarctica: sleep characteristics and bright light treatment [1995, eng] **H-53217**
Numerical model of blowing snow around an antarctic building [1994, eng] **F-52941**
Performance of a surface station on an antarctic ice shelf [1994, eng] **G-52047**
Polarisation of whistlers received on the ground near L=4 [1994, eng] **K-52095**
Satellite Experiments Simultaneous with Antarctic Measurements (SESAME) [1995, eng] **K-52976**
Simultaneous two hemisphere observations of the presence of polar patches in the nightside ionosphere [1994, eng] **K-52034**
Springtime reduction in MF mesospheric echo occurrence [1995, eng] **K-53722**
Studies of the inner magnetosphere based on whistler-mode wave data [1993, eng] **K-53258**
Thermospheric observations from Halley Station [1995, eng] **K-52620**
VELOX: a new VLF/ELF receiver in Antarctica for the Global Geospace Science mission [1995, eng] **K-52481**

Hannah Point
Effect of local weather conditions on the behaviour of moulting southern elephant seals, *Mirounga leonina* (L) [1995, eng] **B-53750**
Geology and volcanic activity at Hannah Point [1994, chi] **E-51729**

Harmony Point
Abundance and distribution of bird populations at The Toe and Harmony Point, Nelson Island [1991, spa] **B-53608**

Haskard Highlands
Petrology of the Shackleton Range [1995, eng] **E-53971**

Hatch Plain
First recorded antarctic occurrence of cordierite [1995, eng] **E-53974**

Heard Island
Evolution and biogeography of a subantarctic alga [1995, eng] **B-53171**
Lactation expenditure in antarctic fur seals [1995, eng] **B-53519**
Marine mammals exposed to transmissions from the Heard I. Feasibility Test [1994, eng] **B-52124**
Newsletter, No.29, June 1992 [1992, eng] **A-52672**
Scope of the Information Brochures of the Antarctic Society of Australia [1993, eng] **A-52857**
Status of fur seals in the Australian Subantarctic [1993, eng] **B-52858**

Heimefront Range
Climate sensitivity of antarctic blue-ice areas [1995, eng] **F-53493**
First lichen and moss collections from Heimefront Range [1995, eng] **B-53464**
Local climate, circulation and surface-energy balance of an antarctic blue-ice area [1994, eng] **F-52914**
Sedimentation in the Heimefront Range [1994, ger] **E-52523**
Surface energy balance of antarctic snow and blue ice [1995, eng] **F-52537**
Synoptic forcing of wind and temperature 300 km from the antarctic coast [1995, eng] **I-53959**

Heritage Range
Geologic and fission-track studies in West Antarctica [1993, eng] **E-51680**

Hill Island
New antarctic Cretaceous coelenterate [1994, eng] **E-52191**

Hoare, Lake
Hydrologic and geochemical consequences of the merging of Lake Chad with Lake Hoare [1993, eng] **B-53055**
Martian analogs in antarctic lakes [1995, eng] **F-52618**
Phytoplankton fluorescence in perennially ice-covered lakes [1994, eng] **B-52086**
Sediment oxygen profiles in a super-oxygenated antarctic lake [1994, eng] **E-51704**

Hope Bay
Cyanophyta of lakes and ponds of Hope Bay [1995, eng] **B-53686**
Energy requirements of Pygoscelid penguins: a synopsis [1994, eng] **B-51861**
Periphyton flora of some lotic and lentic environments of Hope Bay (Antarctic Peninsula) [1995, eng] **B-53411**
Post-hatching diet of Adélie penguins in Hope Bay, 1987-1988 [1995, eng] **B-53412**
Restoration of the Swedish hut in Hope Bay [1994, spa] **A-51744**

Howard, Mount
New German ice drill [1994, eng] **F-52580**
Terrestrial heat flow in glaciated terrain of Victoria Land [1994, eng] **L-53031**

Howe, Mount
Blue ice and green ice [1993, eng] **F-53057**

Hurd Peninsula
Geomorphology and neotectonics of Hurd Peninsula [1995, eng] **E-53957**

Hut Point
Polar excavation techniques and technology [1989, eng] **A-53422**

Indian Ocean
Accumulation of organic matter in sediments of the Indian Ocean [1992, eng] **E-52110**
Biosiliceous sedimentation patterns for the Indian Ocean during the last 45 million years [1992, eng] **E-52111**

- CASERTZ geomagnetic activity [1995, eng] K-53917
- Climate records covering the last glaciation [1995, eng] I-53281
- Devonian rocks of Antarctica [1988, eng] E-53530
- Electrical resistivity measurements on Ice Stream B, Antarctica [1994, eng] F-52909
- Evaluation of strain rates on Ice Stream B by GPS measurements [1994, eng] F-52929
- Geologic events of the past 100 million years revealed by K-Ar dating of volcanic rocks from Marie Byrd Land [1994, eng] E-51952
- Geological investigations in eastern Marie Byrd Land, West Antarctica [1993, eng] E-51664
- High-resolution radar on Ice Stream B2 [1994, eng] F-52913
- Katabatic winds across Ross Ice Shelf [1993, eng] I-52144
- Role of the margins in the dynamics of an active ice stream [1994, eng] F-52635
- Ross Sea (Antarctica): a review of the geological and geophysical exploration [1993, eng] E-51762
- Tectonic implications of paleomagnetic studies of antarctic rocks [1995, eng] E-52886
- Temperature measurements in the margin of ice stream B, 1992-1993 [1993, eng] F-51792
- Thickness and bed topography of Upstream B from radar sounding [1994, eng] F-52912
- Vertical temperature profile of ice stream B [1993, eng] F-51791

Marion Island
- Artifacts stranded on southern ocean islands [1987, eng] B-51818

Diets and dietary segregation of sooty albatrosses on Marion I. [1995, eng] B-52309
Elephant seals at Marion I. [1994, eng] B-52355
Gentoo penguins breeding at Marion I. [1981, eng] B-51812
Liparid fish from the subantarctic Indian Ocean [1995, eng] B-52525
Newsletter/Nuusbrief, No.538, Jan. 1994 [1994, eng] A-52666
Penguin diet variations on Marion I. [1989, eng] B-52083
Recently established Diptera and Lepidoptera on Marion I. [1994, eng] B-52272
Sex-specific and latitudinal variance in postnatal growth of the subantarctic fur seal [1994, eng] B-52472
Taxonomy of petrels related to vocalizations [1995, eng] B-52576
Temperature effects on locomotor activity rates of subantarctic oribatid mites [1995, eng] B-52336
Timing of King penguin breeding at Marion Island [1994, eng] B-51833

Marr Ice Piedmont
NNSS and GPS monitor very slow ice motion [1986, eng] F-53383

Mawson Coast
Tardigrades from Mawson Coast [1995, eng] B-53329

Mawson Glacier
Glacial history of the area between the David and Mawson glaciers [1994, eng] F-52898

Mawson Station
Age dating a Mawson charnockite [1994, eng] E-53282
Antarctic mesospheric dynamics [1992, eng] K-53309
Carbon monoxide in the antarctic atmosphere: observations of decreasing concentrations [1993, eng] I-53063
Current ANARE machinery and vehicles [1992, eng] G-52456
Diurnal tide in the antarctic and arctic mesosphere/lower thermosphere regions [1995, eng] I-52101
High latitude atmospheric tidal behavior [1989, eng] K-53388
Newsletter, No.29, June 1992 [1992, eng] A-52672
Thermospheric horizontal winds above Mawson, Antarctica [1995, eng] K-53202
Thermospheric vertical winds above Mawson, Antarctica [1995, eng] K-52585

Maxwell Bay
Microbes in the area of the South Shetland Islands [1994, eng] B-52273

McMurdo Dry Valleys
Antarctic journal of the United States, vol.28, no.4 [1993, eng] A-53565
Antarctic journal of the United States, vol.29, no.1 [1994, eng] A-53566
Biologically active substances produced by antarctic cryptoendolithic fungi [1993, eng] B-53056
McMurdo Dry Valleys: a cold desert ecosystem [1993, eng] B-52602
Microbial succession inside desert rocks [1993, eng] B-51778
Morphological view on potential niches for exobiology on Mars [1995, eng] B-53717
Nanoclimate data from McMurdo Dry Valleys [1993, eng] I-52149

McMurdo Ice Shelf
Factors affecting the water clarity of ponds on the McMurdo Ice Shelf, Antarctica [1995, eng] B-52836
Glaciology of the McMurdo Ice Shelf in the area of air operations [1995, eng] F-53925
Growth of antarctic cyanobacteria under ultraviolet radiation [1995, eng] B-52873
In-situ dielectric constant of polar firn revisited [1995, eng] F-53331
Planktonic communities of melt ponds on the McMurdo Ice Shelf, Antarctica [1995, eng] B-53930
Recent survey of brine infiltration in McMurdo Ice Shelf, Antarctica [1994, eng] F-52922

McMurdo Sound
Antibiotic resistance of intestinal bacteria from the indigenous fauna of McMurdo Sound, Antarctica [1993, eng] B-52249
Biochemistry and freezing avoidance properties of the snailfish *Paraliparis devriesi* [1995, eng] B-52237
Biochemistry of an antarctic scallop shell [1995, eng] B-53211
Chemical defense of an antarctic nudibranch and its prey [1994, eng] B-52777
Chemical defenses in antarctic soft corals [1995, eng] B-53653
Chemical ecology of marine invertebrates in McMurdo Sound [1993, eng] B-52256
Chemical ecology of sponges from McMurdo Sound [1993, eng] B-52257
Diving seal films itself [1992, eng] B-53634
Effect of chronic heat stress on cortisol levels in the antarctic fish *Pagothenia borchgrevinki* [1995, eng] B-53753
Effect of low temperature on BOD in antarctic seawater [1994, eng] J-51988
Energetics and nutrient transport in young echinoderms [1994, eng] B-52415
Eocene dinoflagellates form CIROS-1 drill hole, McMurdo Sound, Antarctica [1994, eng] E-51930
Geochemical signatures of meltwater in mollusc shells from antarctic coastal areas during the Holocene [1994, eng] E-52072
Heavy metal contamination in some soils of the McMurdo Sound region, Antarctica [1995, eng] E-52308
Human contamination of Arthur Harbor and McMurdo Sound [1995, eng] J-53548
Intracerebral ocelli in the giant antarctic slater [1995, eng] B-52796
Isotopic analysis of Ross Sea ice sheet deposits, McMurdo Sound [1995, eng] E-52972
K-Ar ages of igneous and metamorphic rocks from McMurdo, Sør Rondane and Dumont d'Urville, Antarctica [1994, eng] E-52027
Magnetic petrology of lower crust and upper mantle xenoliths from McMurdo Sound, Antarctica [1995, eng] L-53980
Microalgal light-harvesting in McMurdo Sound [1995, eng] B-53547
Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] B-52555
Notothenioid periventricular morphology [1995, eng] B-53739
Oxygen uptake in teleost *Pagothenia borchgrevinki* and X-cell gill disease [1990, eng] B-53819
Paleontology of Tertiary glacial erratics from the McMurdo Sound region [1993, eng] E-51669
Physiological and behavioral ecology of juvenile Weddell seals [1993, eng] B-52268
Population structure and feeding deterrence in three shallow-water antarctic soft corals [1995, eng] B-53199
Pteroenone: a defensive metabolite of the abducted antarctic Pteropod *Clione antarctica* [1995, eng] B-52826
Seismic stratigraphy in McMurdo Sound: correlation of high resolution data sets [1994, eng] E-51931
Statistical classification of diving behavior [1995, eng] B-52877
Survival of intracellular freezing by the antarctic nematode *Panagrolaimus davidi* [1995, eng] B-53532
Telepresence in the human exploration of Mars: field studies in analog environments [1993, eng] A-53813
Variability of physical and structural characteristics of antarctic fast ice [1994, eng] F-52899

McMurdo Station
Antarctic benthos: present position and future prospects [1994, eng] B-51699
Antarctic Meteorological Research Center: 1992-1993 [1993, eng] I-53677
Aromatic hydrocarbon exposure in fish near Palmer and McMurdo stations [1995, eng] B-53581
Biodiversity of gas vacuolate bacteria from antarctic sea ice and water [1995, eng] B-53754
Brain morphology in antarctic notothenioids [1995, eng] B-52413
Chemical defense in a marine mollusca [1994, eng] B-52401
Chlorine monoxide variations in the spring antarctic vortex [1995, eng] I-53429
Compacted snow runway technology at McMurdo [1995, eng] G-53924
Construction of a glacial ice runway and wheeled flight operations at McMurdo, Antarctica [1994, eng] G-52657
Detection of crevasses near McMurdo Station, Antarctica with airborne short-pulse radar [1995, eng] F-53174
Establishing a real-time video link to Antarctica [1995, eng] A-52565
Evidence for midwinter chemical ozone destruction over Antarctica [1995, eng] I-53721
Evolution of the dehydration in the antarctic stratospheric vortex [1995, eng] I-53425
Federal Standard 1045 high-frequency radio performance [1994, eng] G-53538
Foley Doctrine revisited: application of the Resource Conservation and Recovery Act of 1976 in Antarctica [1991, eng] M-53988
Form and function in antarctic notothenioid fish [1994, eng] B-52418
FY 1994 ambient air monitoring report for McMurdo Station, Antarctica [1994, eng] I-53145
High latitude aspects of a differential GPS aircraft landing system [1994, eng] G-53636
High-resolution spectroscopy and electron precipitation [1995, eng] K-53983
Infrared atmospheric absorption and emission studies [1993, eng] I-53059
Measurement and analysis of polar stratospheric ClO and N_2O by ground-based mm-wave spectroscopy [1994, eng] I-53445
Neuromasts in antarctic nototheniids [1994, eng] B-52414
Ozone abundance, cloud effects, and spectral irradiance [1991, eng] I-54012
Ozone and aerosol profiles at McMurdo Station, spring 1992 [1993, eng] I-53060
People and place: the antarctic environmental relationship [1993, eng] H-53680
Polar stratospheric clouds and atmosphere temperature at McMurdo Station, winter 1992 [1994, eng] I-52501
Potential for bioremediation of fuel-contaminated soil in Antarctica [1995, eng] B-53725
Presumption against extraterritorial application of National Environmental Policy Act [1994, eng] M-53531
Satellite data compared to field observations of stratospheric trace gases during spring of 1992 [1993, eng] I-53061
Spring 1993—record low antarctic ozone season [1995, eng] I-52652
Statistical study of hydromagnetic chorus events at very high latitudes [1995, eng] K-52511
Stratospheric ClO profiles from McMurdo Station, Antarctica, spring 1992

[1995, eng] I-52514
Subsurface radar investigations at the Pegasus Glacial-Ice Runway and Williams Field [1994, eng] F-52446
Survival and recoverability of enteric bacteria exposed to the antarctic marine environment [1993, eng] B-52250
U.S. antarctic activities, 1992-1993 [1993, eng] A-51661
U.S. Antarctic Program overland transportation capability [1988, eng] G-53238
Ultraviolet radiation and its extinction in antarctic sea ice [1993, eng] F-51801
United States Antarctic Program [1994, eng] A-53541

Melbourne, Mount
Fulvic acids in the antarctic snow "via marine aerosol" [1994, eng] F-52655
Further evidence of marine organic matter transport in antarctic snow via air-sea exchange [1994, eng] I-52492

Mesa Range
Geochemistry of the Ferrar tholeiites [1919, eng] E-53922

Miller Range
Evolution of the Miller Range shear zone [1993, eng] E-52451

Minna Bluff
Snow temperature, wind speed, and wind direction around the Pegasus Runway during 1992 [1993, eng] I-53074

Mirnyy Station
Correlation between variations of cosmic noise absorption and near-Earth atmospheric pressure [1994, eng] K-53613
Polar atmospheric transmittance decrease due to volcanic aerosols [1993, eng] I-52052
Spectroscopic measurements of carbon monoxide in the Antarctic atmosphere [1994, rus] I-52689

Mizuho Plateau
Crustal density structure of the Mizuho Plateau, East Antarctica from gravity survey in 1992 [1994, eng] L-52018
Crustal structure and bedrock topography around Mizuho Plateau [1994, eng] L-52019

Mizuho Station
Bubble volumes in firn-ice transition layers of ice cores [1994, eng] F-52904
Glaciological data collected by JARE-30, 31 and 32, 1989-1991 [1995, eng] F-52800
Glaciological data collected by JARE-34, 1993 [1995, eng] F-52799
Ice-sheet radio-echo internal reflections and ice dielectric properties [1994, eng] F-52902
Ion concentrations in drifting snow samples from Queen Maud Land [1994, eng] F-52924
Katabatic winds over the sloping ice sheet at Mizuho Station [1994, eng] I-52188
Meteorological data at Showa, Mizuho and Asuka Stations, 1961-1993 [1995, eng] I-53191
Surface mass balance in east Queen Maud Land [1994, eng] F-52927

Molodezhnaya Station
Antarctic mesospheric dynamics [1992, eng] K-53309
Artificially compacted snow and temperature regime in a glacier active layer [1992, rus] F-53595
CAO data on the dependence of ozone density and relative mixture on angle of maximum solar elevation [1992, rus] I-53555
Correlation between variations of cosmic noise absorption and near-Earth atmospheric pressure [1994, eng] K-53613
Diurnal tide in the antarctic and arctic mesosphere/lower thermosphere regions [1995, eng] I-52101
Effects of temperature and density on snow cover stability of the Molodezhnaya runway [1992, rus] F-53590
Mesospheric ozone investigations in south polar regions [1992, rus] I-53554
Midday recovery of the polar cap absorption of 19-21 March 1990: a case study [1995, eng] K-52851
MOF diurnal variations at the subauroral radio line Bellingshausen-Molodezhnaya [1994, eng] K-53612
Spectroscopic measurements of carbon monoxide in the Antarctic atmosphere [1994, rus] I-52689
Spring and summer radiation regime in artifically compacted snow. [1992, rus] F-53594
Temperature regime of artificially compacted snow of the Molodezhnaya runway [1992, rus] F-53591
Total ozone concentrations during the antarctic spring anomaly of 1989 [1992, rus] I-53553
Use of GRID information for hydrometeorological support operations in Antarctica [1992, rus] I-53589

Müller Ice Shelf
Late Holocene advance of the Müller Ice Shelf [1995, eng] E-52838
Mapping ice front changes of Müller Ice Shelf, Antarctic Peninsula [1995, eng] F-52842

Mulock Glacier
Katabatic winds along the Transantarctic Mountains [1993, eng] I-52143

Nansen Ice Sheet
Monthly mean climatic data for antarctic automatic weather stations [1993, eng] I-52140
Nature of katabatic winds at Terra Nova Bay [1993, eng] I-52142

Napier Mountains
Stability of osumilite in metapelitic granulites [1995, eng] E-53570

Nebles Point
Geology of Nebles Point, King George I. [1989, spa] E-52964

Nelson Island
Crystal fabrics of firn/ice cores from shallow boreholes on Nelson Ice Cap, Antarctica [1994, chi] F-51747
Glaciological studies on Nelson Island, South Shetland Islands, Antarctica [1995, eng] F-53641
Stomach contents of the blue-eyed shag from Nelson I. [1995, eng] B-53111
Volcanic ash accumulation on Nelson I. [1994, eng] E-52400

Neptune Range
Sea level and stratigraphy in the Neptune Range [1995, eng] E-52691

Neumayer Station
Medical studies at Neumayer Station in 1984 [1995, ger] H-53535
Radar snow accumulation gradient measurements on coastal Queen Maud Land [1994, eng] F-52297

New Harbor
Biochemistry of an antarctic scallop shell [1995, eng] B-53211

Newall Glacier
Late Holocene ice core history of the TAM [1995, eng] F-53919

Nordenskjöld Coast
New isotopic ages of schists from Nordenskjöld Coast [1995, eng] E-52841

Norvegia, Cape
Sterols in antarctic waters [1995, ger] B-52869
Transport and structure of the Weddell Gyre [1994, eng] J-52008

Oasis Station
Technico-economical characteristics of photovoltaics and windmills for the Antarctic inland stations [1994, eng] G-53442

Oates Coast
Geology of Ringgold Knoll [1994, eng] E-52822

Ohio Range
Permian nonmarine bivalves from the Ohio Range, Antarctica [1984, eng] E-52820

Ongul Island
Explanatory text of geological map of Ongul Islands, Lützow-Holm Bay, Antarctica [1994, eng] E-52123

Ongul Sound
Micrometeorological observation over the fast ice at Ongul Strait near Syowa Station [1994, eng] I-52760

Orville Coast
Fossil bivalves from the Antarctic Peninsula region [1995, eng] E-52399

Palmer Archipelago
Bacterial exoprotease activity in the Antarctic Peninsula region, autumn 1993 [1993, eng] B-52740
Polymerization of antarctic fish tubulins [1994, eng] B-53212

Palmer Land
Peraluminous granites in NE Palmer Land [1995, eng] E-52846

Palmer Station
α-globin genes in antarctic icefish [1995, eng] B-52678
Antarctic benthos: present position and future prospects [1994, eng] B-51699
Antarctic cloud scattering depth using ground-based radiometry [1995, eng] I-54000
Antarctic sea urchin responses to UV-B and solar radiation exposure [1993, eng] B-52247
Aromatic hydrocarbon exposure in fish near Palmer and McMurdo stations [1995, eng] B-53581
Biodiversity of gas vacuolate bacteria from antarctic sea ice and water [1995, eng] B-53754
Carbon monoxide in the antarctic atmosphere: observations of decreasing concentrations [1993, eng] I-53063
Detection of polar stratospheric clouds over Antarctica [1995, eng] I-52974
Effects of UV radiation on antarctic plankton [1995, eng] B-53969
Fuel removal from the *Bahía Paraíso*, Dec. 1992-Jan. 1993 [1993, spa] G-53557
Infrared optical properties of clouds over the maritime Antarctic [1993, eng] I-53317
Krill grazing on *Nitschia* sp. and *Phaeocystis* sp. monocultures [1993, eng] B-52738
Mapping of surface UV over Antarctica using satellite observations [1993, eng] I-53316
Measured and modelled UV-B spectrum compared with some atmospheric parameters [1993, eng] I-53318
Palmer long-term ecological research (LTER): An overview of the 1992-1993 season [1993, eng] B-52734
Palmer LTER: Dissolved silicic acid-nitrate relationships during austral autumn 1993 [1993, eng] J-52739
Palmer LTER: Krill distribution and biomass within coastal waters near Palmer Station [1993, eng] B-52737
RACER: The tides at Palmer Station [1993, eng] J-52716
Radiation risk [1990, eng] K-53937
Reproductive effort and foraging energetics in Adélie penguins [1993, eng] B-52265

Spectroscopic measurements of carbon monoxide in the Antarctic atmosphere [1994, rus] I-52689
U.S. antarctic activities, 1992-1993 [1993, eng] A-51661
U.S. Antarctic Marine Living Resources (AMLR) program: 1992-1993 field season activities [1993, eng] B-52724
United States Antarctic Program [1994, eng] A-53541

Papua Beach
Marine corrosion of metal alloys of wide technological use in extreme environmental conditions [1991, eng] B-53883

Paradise Harbor
Biogenic production of dimethyl sulfide: krill grazing [1993, eng] B-52260
Data analysis from the summer expedition of 1992-1993 [1994, spa] J-51742
Dimethyl sulfide concentrations near the Antarctic Peninsula: November 1992 [1993, eng] B-52255
Palmer LTER: Aquatic virus abundances near the Antarctic Peninsula [1993, eng] B-52746

Pardoe, Mount
Preliminary results for the Sm-Nd whole-rock age of the metamorphic rocks from Mount Pardoe [1994, eng] E-52025

Patagonia
Female southern elephant seals from Patagonia [1995, eng] B-53571
Pelagic communities of seabirds in the South Atlantic Ocean [1995, eng] B-52175

Patagonian Shelf
Oceanic tides in the South Atlantic Ocean [1994, eng] J-52010

Penguin Island
Elemental and clay mineralogical composition of some soils on Penguin I. [1994, eng] E-52989

Pennell Coast
Plankton as an indicator of water transport in the Antarctic [1994, eng] B-52521

Pensacola Mountains
History of place-names in the British Antarctic Territory [1991, eng] A-52574

Peter I Island
Cenozoic volcanism in Antarctica: Jones Mountains and Peter I Island [1995, eng] E-53625

Petermann Ranges
Fold deformational history and shape in the metamorphic rocks of the Petermann Range [1992, eng] E-52092

Pine Island Bay
Variability of physical and structural characteristics of antarctic fast ice [1994, eng] F-52899

Pine Island Glacier
Velocities of Pine Island Glacier, West Antarctica, from ERS-1 SAR images [1995, eng] F-53497

Pioneers Escarpment
Metasediments from the Pioneers Escarpment [1995, eng] E-53975

Possession Island
Biochemistry of fasting macaroni penguins during molt [1994, eng] B-53323
Breeding cycle fasting in king penguins [1994, eng] B-52519
Hunting techniques in killer whales from Possession I. [1995, eng] B-53526
New *Bothrometopus* species from Possession I. [1994, eng] B-52271

Potter Cove
Life history, morphology and development of the antarctic brown alga [1995, eng] B-53360

Prince Charles Mountains
Igneous rock geochemistry, Prince Charles Mountains [1994, eng] E-51707
Inherited Sm/Nd isotope components preserved in monazite inclusions within garnets [1995, eng] E-53144
Late Triassic plant fossils from the Prince Charles Mountains, East Antarctica [1995, eng] E-52314
Late Triassic Tethyan palynomorphs [1994, eng] E-52748
Role of mylonites in the uplift of an oblique lower crustal section, East Antarctica [1995, eng] E-52474

Prince Edward Island
Artifacts stranded on southern ocean islands [1987, eng] B-51818

Princess Martha Coast
Seasonal distribution and density changes in pack ice seals [1995, eng] B-53953

Prydz Bay
Accumulation of organic matter in sediments of the Indian Ocean [1992, eng] E-52110
Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Symposium [1995, eng] E-53172
Cenozoic sedimentary record of the Prydz Bay continental shelf, East Antarctica [1994, eng] E-51939
Cenozoic seismic stratigraphy of Prydz Bay (Antarctica) [1994, eng] E-51938
Chemical characteristics of sea water in the Prydz Bay, Antarctica [1994, eng] J-52280
Closure temperature of isotopes in garnets [1995, eng] E-53152
Clustering analysis of net phytoplankton in Prydz Bay, summer 1991-1992 [1995, chi] B-53947
Condition for the formation of Antarctic Bottom Water in Prydz Bay, Antarctica [1994, eng] J-51728
History of antarctic glaciation: an Indian Ocean perspective [1992, eng] E-52114
Hydrocarbons and sterols in marine sediments and soils at Davis Station [1995, eng] B-52835
Krill reproduction in Prydz Bay [1995, eng] B-53993
Long-term dynamics of phytoplankton biomass in the Commonwealth Sea during summers 1977-1988 [1993, rus] B-53776
Melting metapelites at Brattstrand Bluffs [1995, eng] E-53742
Morphology and anatomy of *Avdeevia antarctica*, n.gen. n.sp., a cephalopod parasite [1994, eng] B-52099
Morphology and late glacial history of Prydz Bay, Antarctica, based on echo sounder data [1994, eng] E-51940
Morphology and seismic stratigraphy of the Denmark Strait compared with Prydz Bay [1994, eng] E-51946
Pan-African granulite facies metamorphic episode in Prydz Bay [1995, eng] E-53220
Physical parameters influencing diatom community structure in eastern antarctic sea ice [1994, eng] B-51766
Phytoplankton composition and cell carbon distribution in Prydz Bay [1995, eng] B-52797
Phytoplankton sediments as indicator of paleoenvironment [1995, eng] E-53310
Predation of Adélie penguins by leopard seals in Prydz Bay [1995, eng] B-53730
Summer distribution of nano- and microalgae in Prydz Bay and the Indian Ocean [1994, eng] B-52277
Tectonics of Larsemann Hills granulites [1995, eng] E-52534

Queen Fabiola Mountains
Mössbauer spectroscopic study of meteorites recovered on Antarctica [1994, eng] E-53586
Origins of Yamato Mountains syenites [1995, eng] E-53347
Syenite emplacement pressure estimated from amphibole from the Yamato Mountains [1994, eng] E-52021
Terrestrial ages of antarctic meteorites [1993, eng] E-52681
Yamato-8451: a newly identified pyroxene-bearing pallasite [1995, eng] E-53333

Queen Maud Land
Ages and ablation and accumulation rates from ^{14}C measurements on antarctic ice [1995, eng] F-53490
Atmospheric circulation adjacent to a blue ice area, Antarctica [1995, eng] I-52770
Basement complex evolution, Queen Maud Land [1995, ger] E-54032
Bedrock topography by mobile radio echo sounder in Queen Maud Land [1994, eng] F-52764
Brooding and incubation behavior of the antarctic petrel [1995, eng] B-53811
Cold tolerance in Tardigrada from Dronning Maud Land, Antarctica [1995, eng] B-52598
Crabeater seal distribution and diving behavior off Queen Maud Land [1995, eng] B-52783
Egg size and early nestling growth in the Snow Petrel [1995, eng] B-53372
Ion concentrations in drifting snow samples from Queen Maud Land [1994, eng] F-52924
Microparticles in ice cores from east Queen Maud Land [1994, eng] F-52901
Momentum and scalar transfer coefficients over aerodynamically smooth antarctic surfaces [1995, eng] I-53044
Nematodes, rotifers and tardigrades from nunataks in Queen Maud Land [1995, eng] B-52337
Oceanographic and glaciological investigations in Queen Maud Land, 1991-1992 [1994, eng] F-52607
Queen Maud Land, Antarctica [1994, nor] A-53240
Ritscher Canyon off Breid Bay, Dronning Maud Land, East Antarctica [1994, eng] E-52030
Seabird studies at Svarthamaren, Dronning Maud Land [1994, eng] B-52606
Sedimentation in the Heimefront Range [1994, ger] E-52523
Sill emplacements in wet sediments [1994, eng] E-53561
Snow petrel breeding biology at Roberts Knoll [1989, eng] B-52081
South African geosciences in Antarctica: the third decade [1993, eng] E-52162
Spectral bidirectional reflectance of snow and glacier ice [1994, eng] F-52889
Subsurface melting in blue-ice fields in Queen Maud Land [1995, eng] F-53494
Surface energy balance of antarctic snow and blue ice [1995, eng] F-52537
Surface mass balance in east Queen Maud Land [1994, eng] F-52927
Swedish Antarctic Research Programme 1992/93; a cruise report [1995, eng] A-52641
Swedish Antarctic Research Programme 1993/94; a cruise report [1995, eng] A-52640
Weddell Province aeromagnetic survey [1992, eng] C-51810

Racer Rocks
RACER: Racer Rocks [1993, eng] A-52715

Radian Glacier
Petrogenesis of carbonate-bearing nepheline syenites and carbonatites from Victoria Land [1995, eng] E-53222

Read Mountains
- First recorded antarctic occurrence of cordierite [1995, eng] E-53974
- Petrology of the Shackleton Range [1995, eng] E-53971

Reeves Glacier
- Monthly mean climatic data for antarctic automatic weather stations [1993, eng] I-52140
- Nature of katabatic winds at Terra Nova Bay [1993, eng] I-52142

Rennick Glacier
- Geochemistry of the Ferrar tholeiites [1919, eng] E-53922

Ricker Hills
- New German ice drill [1994, eng] F-52580
- Terrestrial heat flow in glaciated terrain of Victoria Land [1994, eng] L-53031

Ridley Beach
- Archaeology of Borchgrevink's stores hut, Cape Adare, Antarctica [1991, eng] A-53421

Riiser-Larsen Ice Shelf
- Chemical fractionation of sea salt in snow [1994, eng] F-52609
- Radar studies and mapping under the Riiser-Larsen Ice Shelf [1994, eng] F-52610

Ringgold Knoll
- Geology of Ringgold Knoll [1994, eng] E-52822

Ritscher Upland
- Age of the Ritscher Upland Supergroup and Borg Massif Intrusions [1995, eng] E-52317

Robert Island
- Lipids of *Deschampsia antarctica* [1994, eng] B-52423
- Size structure of tussocks of *Deschampsia antarctica* from Robert I. [1994, eng] B-52155
- Soluble carbohydrates and polyols as plant cryoprotectants [1993, eng] B-53272

Roberts Knoll
- Habitat temperature and locomotor activity of the mite *Maudheimia petronia* Wallwork [1995, eng] B-52335
- *Plectus antarcticus* de Man from western Queen Maud Land [1995, eng] B-53128
- Snow petrel breeding biology at Roberts Knoll [1989, eng] B-52081

Robertson Island
- Geophysical studies of the Antarctic Peninsula [1994, eng] E-53968

Ronne Ice Shelf
- Airborne radio echo sounding on the Evans flowline, Ronne Ice Shelf [1994, eng] F-52293
- Antarctic field measurements of radar backscatter from snow [1995, eng] F-52613
- Elevation data of a satellite-image map of Filchner-Ronne Ice Shelf [1994, eng] F-52942
- Filchner-Ronne Ice Shelf bottom melting [1994, eng] F-52578
- Filchner-Ronne Ice Shelf Programme, Report No.8 (1994) [1994, eng] F-52291
- History of place-names in the British Antarctic Territory [1991, eng] A-52574
- Ice impact on Weddell Sea physical characteristics [1994, eng] J-51695
- Internal structures of the Filchner-Ronne Ice Shelf [1994, eng] F-52945
- Melting and freezing beneath ice shelves and ocean circulation [1994, eng] F-52953
- Melting and freezing rates beneath Filchner-Ronne Ice Shelf from a 3D-ocean circulation model [1994, eng] J-52294
- Microwave scatterometry on antarctic ice shelves [1994, eng] G-52407
- Modeling the formation and deposition of frazil ice beneath Filchner-Ronne Ice Shelf [1995, eng] F-52705
- Near-surface firn from the Ronne Ice Shelf [1994, eng] F-52908
- Non-destructive high resolution density measurements of the B15 ice core [1994, eng] F-52296
- Numerical flow simulation at local parts of Filchner-Ronne Ice Shelf, Antarctica [1994, eng] F-52949
- Numerical modelling of Filchner-Ronne Ice Shelf [1994, eng] F-52298
- Oceanic environment beneath the northwest Ronne Ice Shelf, Antarctica [1994, eng] J-52948
- Reflection amplitudes of 40 MHz monopulse radar sounding [1994, eng] F-52292
- Remote sensing of antarctic ice shelves (Extended abstract) [1989, eng] F-53382
- Sea-bed depths at the mouth of Rutford Ice Stream, Antarctica [1994, eng] F-52943
- Temperature investigation and modeling on the Filchner-Ronne Ice Shelf, Antarctica [1994, eng] F-52947
- Tidal flexure at ice shelf margins [1995, eng] F-52658
- Two-dimensional modelling of stress fields of Filchner and Ronne ice shelves. Extended summary [1994, eng] F-52300
- X-ray microprobe studies of ice and snow [1993, eng] F-53264

Ross Ice Shelf
- Basal friction of Ice Stream E, West Antarctica [1995, eng] F-53639

Microzooplanktonic populations in Terranova Bay (Ross Sea) [1990, eng] **B-53890**
Molecular biology of adaptation to low temperature: partial cloning of hsp70 genes of two antarctic fish [1994, eng] **B-52555**
Morphofunctional design of the heart of the icefish *Chionodraco hamatus* (Lonnberg) [1994, eng] **B-52557**
Nature of katabatic winds at Terra Nova Bay [1993, eng] **I-52142**
Necton and antarctic fishing resources, 1987-1988 [1990, eng] **B-53897**
Nematodes and tardigrades of Antarctica: results of the researches conducted in 1988-1991 [1994, eng] **B-52548**
On the influence of coastline orientation on the steady state width of a latent heat polynya [1995, eng] **F-53432**
Particulate composition and bacterial distribution in Terra Nova Bay, summer 1989-1990 [1995, eng] **B-53410**
Particulate organic matter in Terra Nova Bay [1991, eng] **J-53873**
Photoautotrophic picoplankton of Terra Nova Bay and some northern Victoria Land lakes [1994, eng] **B-52545**
Phytobenthos sampling in Terra Nova Bay, 1989-1990 [1991, eng] **B-53881**
Phytoplankton ecology in the Ross Sea [1990, eng] **J-53901**
Polychaeta "Sedentaria" from Terra Nova Bay: Capitellidae to Serpulidae [1995, eng] **B-52787**
Quantitative and functional studies of the Terra Nova Bay benthos [1991, eng] **B-53880**
Radio echo sounding on Strandline Glacier, Terra Nova Bay (Antarctica) [1993, eng] **F-51761**
Seaweeds from Terra Nova Bay [1990, eng] **B-53896**
Shallow and deep-sea bivalve molluscs from Terra Nova Bay [1994, eng] **B-52808**
Statistical analyses of katabatic winds in the neighborhood of Terra Nova Bay, Antarctica [1990, eng] **I-52231**
Structure and function of hemoglobins, enzymes and other proteins [1994, eng] **B-52554**
Study of copepods from Terra Nova Bay [1990, eng] **B-53903**
Study of humic fractions from water of an antarctic lake [1995, eng] **E-53529**
Terra Nova Bay benthos studies [1990, eng] **B-53893**
Tropospheric hydrogen and carbon oxides in Antarctica and in Greenland [1995, eng] **I-52134**
Zooplankton spatial and vertical distribution in Terra Nova Bay [1990, eng] **B-53891**

Terra Nova Bay Station
Approach to palynological research in the antarctic continent [1994, eng] **B-52546**
Chaos and fractal behaviour of the geomagnetic field over polar caps: some preliminary results [1994, eng] **K-52505**
Chemical composition of particulate organic matter from Terra Nova Bay [1994, eng] **I-52490**
Determining vertical profiles of absolute humidity from atmospheric radiosonde measurements [1994, eng] **I-52486**
Further evidence of marine organic matter transport in antarctic snow via air-sea exchange [1994, eng] **I-52492**
Italian report to SCAR, June 1994 [1994, eng] **A-51822**
Keratinophilic fungi, dermatophytes and anthropization of the Antarctic [1994, eng] **B-52543**
Measurement of gas phase and particulate matter tropospheric components in Antarctica [1994, eng] **I-52489**
Multielemental characterization of aerosols at Terra Nova Bay, summer 1990-

- 1991 [1994, eng] I-52488
- Thermophilic isolates from Antarctica [1994, eng] B-52553
- Two seasons of hydrogen and carbon monoxide observations at Terra Nova Bay (Antarctica) [1994, eng] I-52491

Tierra del Fuego

- Ancient gastropods from southern Pacific regions [1995, eng] B-53646
- New paleomagnetic data from Tierra del Fuego [1991, eng] L-51865
- Paleoclimatic CO_2 record related to changes in oceanic thermohaline circulation [1995, eng] I-53868
- Thermal models of metamorphic petrology in Tierra del Fuego [1995, eng] E-53617

Toe, The

- Abundance and distribution of bird populations at The Toe and Harmony Point, Nelson Island [1991, spa] B-53608

Tonagh Island

- Isotopic equilibration age of Sm-Nd whole-rock system in the Napier Complex (Tonagh Island), East Antarctica [1994, eng] E-52026

Transantarctic Mountains

- ACRUP-1 experiment 1993-94: deep crustal investigations across the Transantarctic Mountains and the adjacent Ross Sea depression (Antarctica) [1994, eng] E-51928
- Aeromagnetic profile over Butcher Ridge [1995, eng] L-53916
- Aeromagnetic surveys over the Transantarctic Mountains and the Ross Sea area [1994, eng] L-53024
- Cambrian and possible Proterozoic strata in the Transantarctic Mountains, north of Leverett Glacier [1993, eng] E-51677
- Cenozoic transtension along the Transantarctic Mountains-West Antarctic rift boundary [1995, eng] E-52845
- Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression [1994, eng] E-53021
- Crustal structure of the Transantarctic Mountains and adjacent Ross Sea depression. Ross Sea Regional Working Group. Geotraverse ACRUP-1 Experiment (1993-94) [1994, eng] E-53019
- Early Cambrian carbonatite in Antarctica [1995, eng] E-53562
- Eclogite-facies metamorphism preserved in tectonic blocks from the Transantarctic Mountains [1995, eng] E-53982
- Fault kinematic studies in the Transantarctic Mountains, southern Victoria Land [1993, eng] E-51673
- Fission-track investigations of lithotectonic history: northern Victoria Land, 1993 [1993, eng] E-51679
- Katabatic winds along the Transantarctic Mountains [1993, eng] I-52143
- Landscape evolution of the Dry Valleys, Transantarctic Mountains: tectonic implications [1995, eng] E-53018
- Late Neogene uplift of the Transantarctic Mountains in the Beardmore Glacier region [1994, eng] E-51955
- Mesozoic terrestrial vertebrates, including a scavenging theropod, from the Transantarctic Mountains [1993, eng] E-51676
- Outline of antarctic Devonian and its comparison with the Chinese Devonian [1995, chi] E-53946
- Paleozoic accretion and deformation of the Bowers Mountains [1995, ger] E-54031
- Permian and triassic fossils in the TAM [1994, eng] E-52772
- Permian-Triassic Transantarctic basin [1994, eng] E-52462
- Reptilian fossils found near Coalsack Bluff [1995, eng] E-53380
- Ross orogen of the Transantarctic Mountains [1995, eng] E-52648
- Satellite-image analysis of the Transantarctic Mountains, southern Victoria Land [1993, eng] C-51672
- Structural kinematic studies in the Transantarctic Mountains, southern Victoria Land [1994, eng] E-53035
- Volcanism and rifting in the TAM [1995, eng] E-53563

Tula Mountains

- Stability of osumilite in metapelitic granulites [1995, eng] E-53570

Vanda, Lake

- ^{210}Pb and stable lead through the redox transition zone of an antarctic lake [1995, eng] E-53239
- Decommissioning Vanda Station, Wright Valley, Antarctica [1994, eng] A-52375
- Historical aspects of Lake Vanda and Don Juan Pond [1995, eng] E-53920
- Soil climate, active layer and permafrost investigations at Scott Base, Vanda and Beacon Heights, 1993/94 [1995, eng] E-52662

Vestfold Hills

- Derived constituents in the glacial sediments of the Vestfold Hills [1994, eng] E-52098
- Difficulties in assessing population status of ice seals [1995, eng] B-53345
- Ice margin form, structure and stability, Vestfold and Bunger Hills [1995, eng] F-52839

New mechanism for polar patch formation [1994, eng] K-51829
On the concentrations of O_2, N_2, and Ar in trapped gases from ice cores [1995, eng] F-53690
Predicting the Vostok CO_2 curve [1995, eng] F-53732
Rapid oscillations in Vostok and GRIP ice cores [1995, eng] I-53724
Recent progress in Vostok ice core analysis studies on ancient air stored in ice cores [1995, jpn] F-53834
Recent progress in Vostok ice core analysis: paleoclimate and paleoenvironment [1995, jpn] I-53835
Spectral bidirectional reflectance and energy absorption rates of antarctic snow [1993, eng] F-53058
Spectroscopic detection of toxic metals in polar snow [1994, eng] F-52051
Study of the paleoclimate in polar regions using deep ice cores from ice sheets [1994, rus] I-52687
Technico-economical characteristics of photovoltaics and windmills for the Antarctic inland stations [1994, eng] G-53442
Trends in global distribution of trace gases inferred from polar ice cores [1994, eng] F-52330
Very long time variations of cosmic ray intensity and their origin [1995, eng] K-51858
Vostok climate record time-scale from a borehole-temperature profile [1994, eng] F-52921

Wasa Station
Sweden's report to SCAR No.7, 1994 [1994, eng] A-52405
Swedish Antarctic Research Programme, 1989/90: a cruise report [1992, eng] A-54013
Swedish building research in Antarctica [1992, eng] G-54014

Weddell Sea
^{228}Ra and ^{228}Th in the Weddell Sea [1994, eng] J-51876
340 year record of biogenic sulphur from the Weddell Sea area, Antarctica [1995, eng] F-53495
Acoustic, trawl and trapping surveys of the epipelagic communities in the Weddell Sea [1993, eng] B-52259
Amino sugars in Bransfield Strait and Weddell Sea sediments [1993, eng] E-52408
Antarctic benthos: present position and future prospects [1994, eng] B-51699
Antarctic bottom water formation and the global cadmium to phosphorus relationship [1995, eng] J-53719
Antarctic Bottom Water formation in the northwestern Weddell Sea [1993, eng] J-51796
Antarctic crustacean metabolism as a depth/seasonal function [1994, eng] B-51659
Antarctic journal of the United States, vol.29, no.1 [1994, eng] A-53566
Antarctic ocean Pleistocene biomass variations from bottom sediments [1995, eng] J-52480
Antarctic Offshore Acoustic Stratigraphy (ANTOSTRAT) Symposium [1995, eng] E-53172
Antarctic sea ice passive microwave signatures during summer and autumn [1994, eng] F-51840
Antarctic zoobenthos [1994, eng] B-52794
Antifreeze glycopeptide in the silverfish *Pleuragramma antarcticum* [1995, eng] B-53327
Atmospheric forcing of sea ice models [1994, eng] F-51880
Bacteria in sea ice and underlying water of the eastern Weddell Sea in midwinter [1995, eng] B-52453
Benthic foraminifers of the Antarctic Peninsula [1994, eng] J-52412
Benthos in polar waters [1995, ger] B-52342
Biological features of copepod species in the Weddell Sea [1994, eng] B-52164
Chlorophyll "a" content in cells of antarctic phytoplankton [1995, eng] B-53416
Chlorophyll variations in Weddell Sea microplankton [1993, eng] B-52118
Circulation and transport of water along the western Weddell Sea margin [1995, eng] J-53655
Comparison of methods for counting seabirds at sea in the southern ocean [1994, eng] B-51973
Comparison of radar backscatter from antarctic and arctic sea ice [1995, eng] F-52614
Comparison of reflection seismic geometries on three different glacial margins [1994, eng] E-51949
Compressive strength and structure of sea ice in the Weddell Sea, Antarctica [1994, eng] F-52048
Controls on antarctic sea ice biological communities [1994, eng] J-51832
Current flow in the north-west Weddell Sea [1995, eng] J-52313
Cytogenetics and morphofunctional adaptations in Notothenioid fishes [1994, eng] B-52549
Description of three endocommensal ciliates from sea urchins in the Weddell Sea [1994, chi] B-51751
Detailed seismic stratigraphy of the Crary Fan, southeastern Weddell Sea [1994, eng] E-51916
Digestibility of krill by minke whales and crabeater seals [1994, eng] B-52448
Distribution and abundance of seasonal variations of *Oithona* and *Oncaea* in the Weddell Sea [1995, eng] B-52594
Distribution of water masses on the continental shelf in the southern Weddell Sea [1994, eng] J-51875
Drift of a giant tabular berg in the antarctic seas [1992, eng] F-51826
Effect of sea ice on the salinity of antarctic bottom waters [1995, eng] J-53626
Effects of heat shock and UV-B radiation on temperate and antarctic diatoms [1995, eng] B-53082
Effects of the snow cover on antarctic sea ice [1995, eng] F-53502
Evaluating primary productivity and dynamics of mineral phosphate [1994, rus] B-52445
Filchner's expedition to the Weddell Sea [1994, eng] D-53635
Formation and discharge of deep and bottom water in the northwestern Weddell Sea [1995, eng] J-53709
Genetic differentiation in antarctic and subantarctic marine invertebrates. [1994, eng] B-52551
Geochemistry of bottom sediments in the Weddell Sea [1993, eng] J-52116
Geochemistry of Bransfield Strait sediments [1990, eng] J-51815
Gut contents and feeding pattern in copepods from the Weddell Sea [1995, eng] B-53932
Helium isotope results from Ice Station Weddell 1 [1993, eng] J-51797
Humic substances in the nitrogen cycle of polar waters [1994, eng] J-52172
Hydrographic model of the Atlantic Ocean, 80N to 70S [1995, eng] J-52506
Ice impact on Weddell Sea physical characteristics [1994, eng] J-51695
Ice impact tests on *Nathaniel B. Palmer* [1995, eng] G-53745
Ice motion analysis on different spatial scales in the Weddell Sea [1995, eng] F-53482
Ice sedimentation in the world ocean [1994, rus] J-52844
Importance of iron for plankton in the southern ocean [1995, eng] B-52289
Improved use of passive microwave data for sea ice detection [1992, eng] F-53615
In situ experimental study of young sea ice formation on an antarctic lead [1995, eng] F-52465
Interaction between antarctic sea ice and ENSO events [1994, eng] F-52761
Intracerebral ocelli in the giant antarctic slater [1995, eng] B-52796
Isotope composition of marine foraminifers [1994, eng] B-52180
Isozyme variation and taxonomic rank of *Contracaecum radiatum* (v. Linstow, 1907) [1995, eng] B-52631
Laboratory reproduction of the copepod *Calanus propinquus* in the Weddell Sea [1994, eng] B-52629
Laser profiling of the ice surface topography during the Winter Weddell Gyre Study 1992 [1995, eng] F-52466
Late Neogene record of paleoenvironmental change from the southern ocean: regional and global implications [1994, eng] E-51960
Lipid biochemistry of antarctic copepods [1995, eng] B-53752
Lipid metabolism of antarctic copepods [1995, ger] B-52301
Long-term Weddell Sea organic carbon accumulation [1994, eng] J-52046
Low-level atmospheric jets and inversions on Ice Station Weddell 1 [1993, eng] I-53068
Macro-scale structure of the Weddell Gyre [1993, rus] J-53762
Marginal ice zone chemistry [1995, eng] B-53277
Method to estimate subpixel-scale coastal polynyas with satellite passive microwave data [1995, eng] F-52464
Model results and satellite data from Weddell Sea ice [1995, eng] F-53477
Model *vs* observations in Weddell Sea ice [1995, ger] F-52870
Modelling the extent of sea ice ridging in the Weddell Sea [1994, eng] F-51877
Modulation of hemispheric sea-ice cover by ENSO events [1995, eng] F-52178
Monitoring of a drifting giant iceberg in the South Atlantic [1992, eng] F-53459
Morphology and morphogenesis of two new species of protozoa from antarctic sea ice [1995, eng] B-53447
Nannofossils from southern high latitudes [1994, eng] E-52396
Neogene collapse of deltas in the Weddell Sea [1994, eng] E-51914
New genus and species of the family Laophontidae from the Weddell Sea

- [1995, eng] B-53254
